Subshifts

Definition 1

Subshifts

A \mathbb{Z}^d subshift is a set of colorings $\mathbb{Z}^d \mapsto \Sigma$ defined by forbidden patterns \mathcal{F} :

$$X_{\mathcal{F}} = \left\{ x \in \Sigma^{\mathbb{Z}^d} : \forall p \in \mathcal{F}, p \text{ does not appear in } x \right\}$$

$$\Sigma = \left\{ \begin{array}{c} \text{purple square} \\ \text{red square} \end{array} \right\} \quad \text{and} \quad \mathcal{F} = \left\{ \begin{array}{c} \text{purple square, red square} \\ \text{red square, purple square} \\ \text{purple square, red square} \end{array} \right\}$$

Subshifts

Definition 1

Subshifts

A \mathbb{Z}^d subshift is a set of colorings $\mathbb{Z}^d \mapsto \Sigma$ defined by forbidden patterns \mathcal{F} :

$$X_{\mathcal{F}} = \left\{ x \in \Sigma^{\mathbb{Z}^d} : \forall p \in \mathcal{F}, p \text{ does not appear in } x \right\}$$

The family \mathcal{F} can be either finite (X is of Finite Type), or infinite.

Classical Domino problem:

Input A SFT (= symbols + finite set of forbidden pattern)

Output Is there an admissible coloring?

Subshifts

Definition 1

Subshifts

A \mathbb{Z}^d subshift is a set of colorings $\mathbb{Z}^d \mapsto \Sigma$ defined by forbidden patterns \mathcal{F} :

$$X_{\mathcal{F}} = \left\{ x \in \Sigma^{\mathbb{Z}^d} : \forall p \in \mathcal{F}, p \text{ does not appear in } x \right\}$$

The family \mathcal{F} can be either finite (X is of *Finite Type*), or infinite.

Aperiodic Domino problem:

Input A SFT (= symbols + finite set of forbidden pattern)

Output Is there an admissible *aperiodic* coloring?

Output Is there an admissible *aperiodic* coloring?

Aperiodic Domino problem on \mathbb{Z}^d

Undecidability of the aperiodic Domino problem

Aperiodic Domino problem:

Input A \mathbb{Z}^d subshift.

Output Is there an admissible *aperiodic* coloring?

Its (computational) complexity depends on the dimension of the subshift.

\implies : separates 2, 3 and 4-dimensional subshifts.

Dimension / type	2D	3D	4D+
finite type	Π_1^0	open	Σ_1^1
sofic	Π_1^0	Σ_1^1	Σ_1^1
effective	Π_1^0	Σ_1^1	Σ_1^1

Difficulty of the Domino problem [GHV 2018, CH 2022].

Undecidability of the aperiodic Domino problem

Aperiodic Domino problem:

Input A \mathbb{Z}^d subshift.

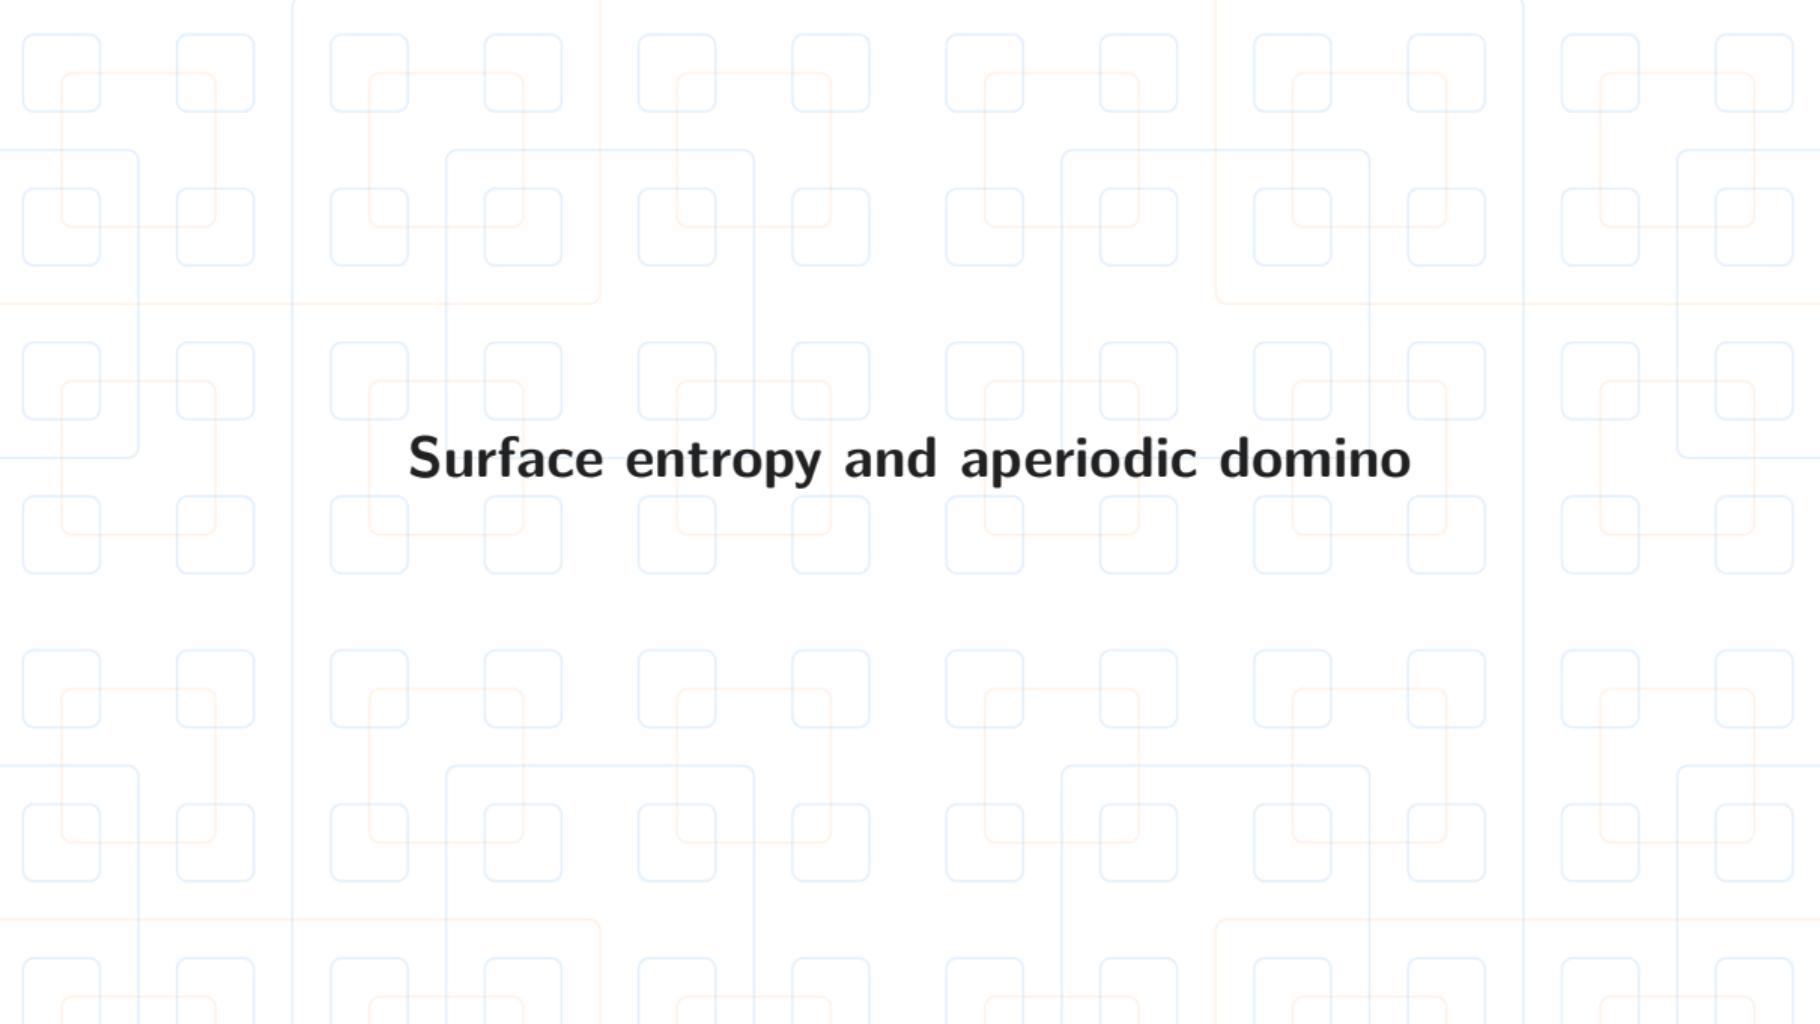

Output Is there an admissible *aperiodic* coloring?

Its (computational) complexity depends on the dimension of the subshift.

\implies : separates 2, 3 and 4-dimensional subshifts.

Dimension / type	2D	3D	4D+
finite type	Π_1^0	$\textcolor{red}{\Pi_1^0?}$	Σ_1^1
sofic	Π_1^0	Σ_1^1	Σ_1^1
effective	Π_1^0	Σ_1^1	Σ_1^1

Difficulty of the Domino problem [GHV 2018, CH 2022].

Surface entropy and aperiodic domino

Complexity function

Definition 2

Complexity function

The *complexity function* $N_X(n)$ is defined as the number of different patterns of size n^d that appear in $X \subseteq \Sigma^{\mathbb{Z}^d}$.

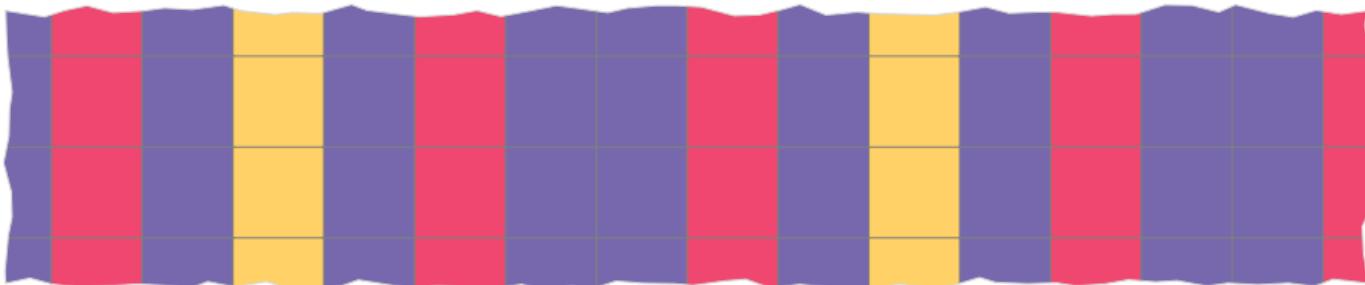

Complexity function

Definition 2

Complexity function

The *complexity function* $N_X(n)$ is defined as the number of different patterns of size n^d that appear in $X \subseteq \Sigma^{\mathbb{Z}^d}$.

Example : the SFT X defined by

$$N_X(2) = 5.$$

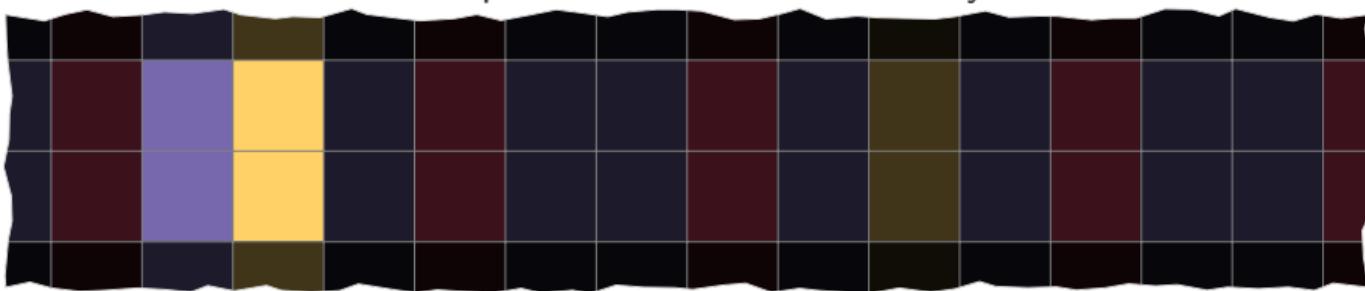

Complexity function

Definition 2

Complexity function

The *complexity function* $N_X(n)$ is defined as the number of different patterns of size n^d that appear in $X \subseteq \Sigma^{\mathbb{Z}^d}$.

Example : the SFT X defined by

$$N_X(2) = 5.$$

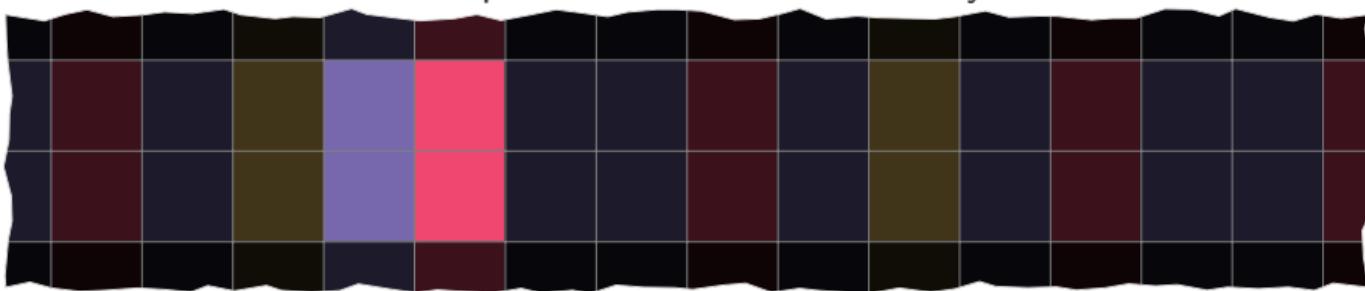

Complexity function

Example : the SFT X defined by

$$N_X(2) = 5.$$

Complexity function

Definition 2

Complexity function

The *complexity function* $N_X(n)$ is defined as the number of different patterns of size n^d that appear in $X \subseteq \Sigma^{\mathbb{Z}^d}$.

Define the surface entropy of X :

$$h_{d-1}(X) = \limsup_{n \rightarrow +\infty} \frac{\log N_X(n)}{n^{d-1}}$$

Theorem 3

[C. Hellouin, Salo]

Let X be any \mathbb{Z}^d subshift. If $h_{d-1}(X) = +\infty$, then there exists an aperiodic configuration in X .

Proof.

For X a \mathbb{Z}^d subshift. Assume $h_{d-1}(X) = \limsup_{n \rightarrow +\infty} \frac{\log N_X(n)}{n^{d-1}}$.

Claim 1: For every $k \in \mathbb{N}$, there exists a border of thickness k with at least two admissible completions of its interior.

Proof.

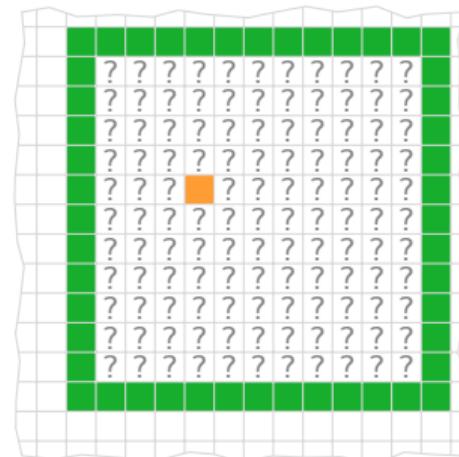

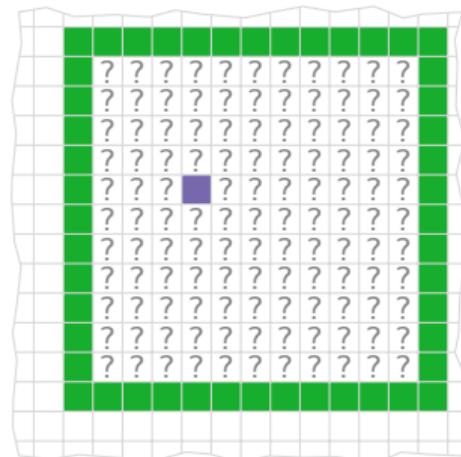

For X a \mathbb{Z}^d subshift. Assume $h_{d-1}(X) = \limsup_{n \rightarrow +\infty} \frac{\log N_X(n)}{n^{d-1}}$.

Claim 1: For every $k \in \mathbb{N}$, there exists a border of thickness k with at least two admissible completions of its interior. Indeed,

$$\#X|_{\partial_k [\![0,n]\!]^d} \leq |\Sigma|^{2d \cdot k \cdot n^{d-1}} \quad \text{and} \quad \#X|_{[\![0,n]\!]^d} = N_X(n)$$

As $\log N_X(n)/n^{d-1}$ is unbounded, there exists $n \in \mathbb{N}$ such that

$$\#X|_{\partial_k [\![0,n]\!]^d} < \#X|_{[\![0,n]\!]^d}$$

Proof.

Proof.

Assume p_l and p_r are respective non-trivial periods for these configurations.

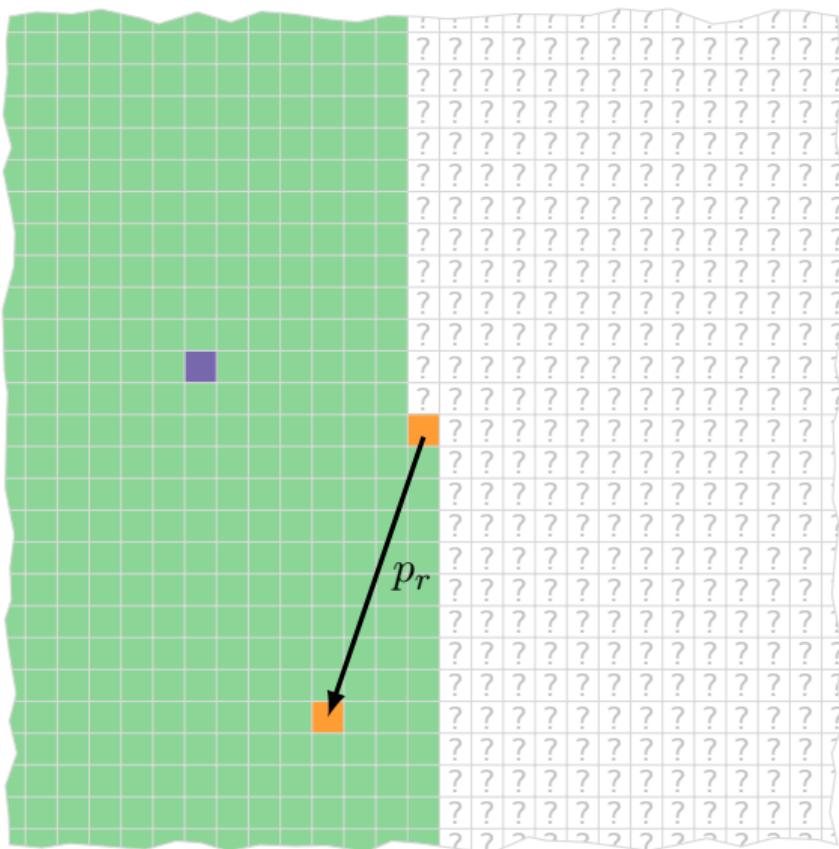

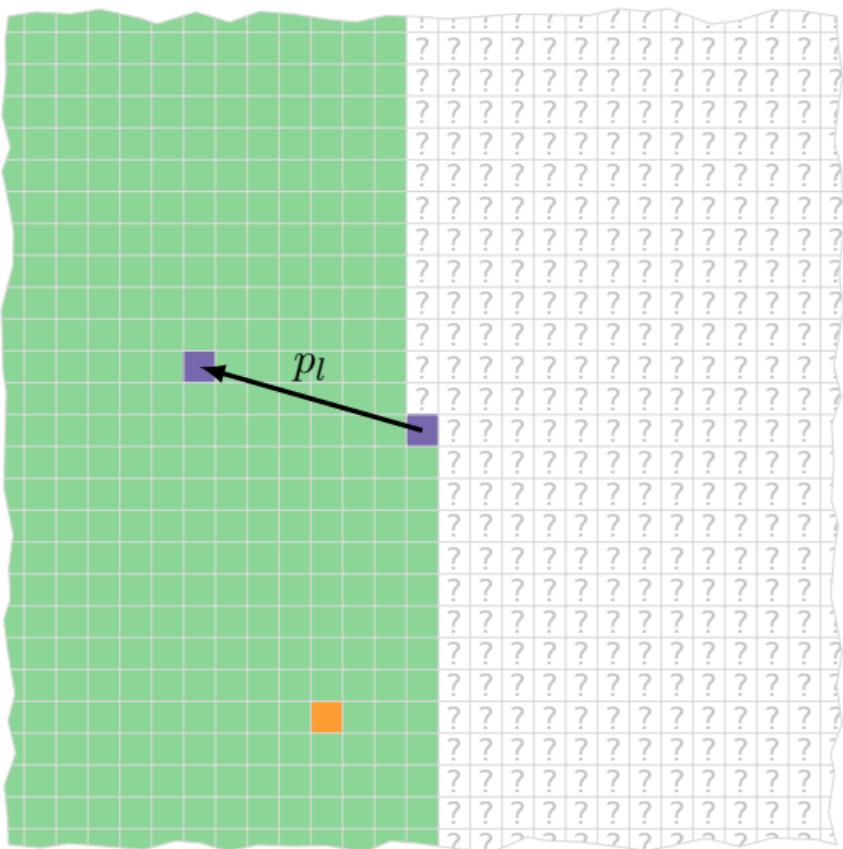

Proof.

Assume p_l and p_r are respective non-trivial periods for these configurations.

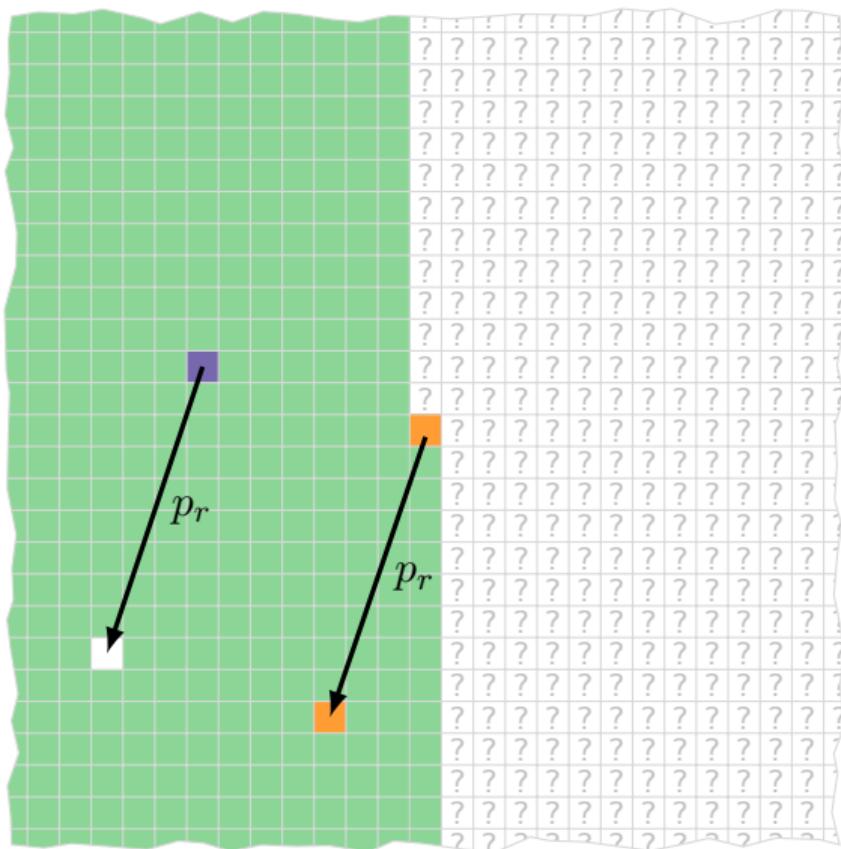

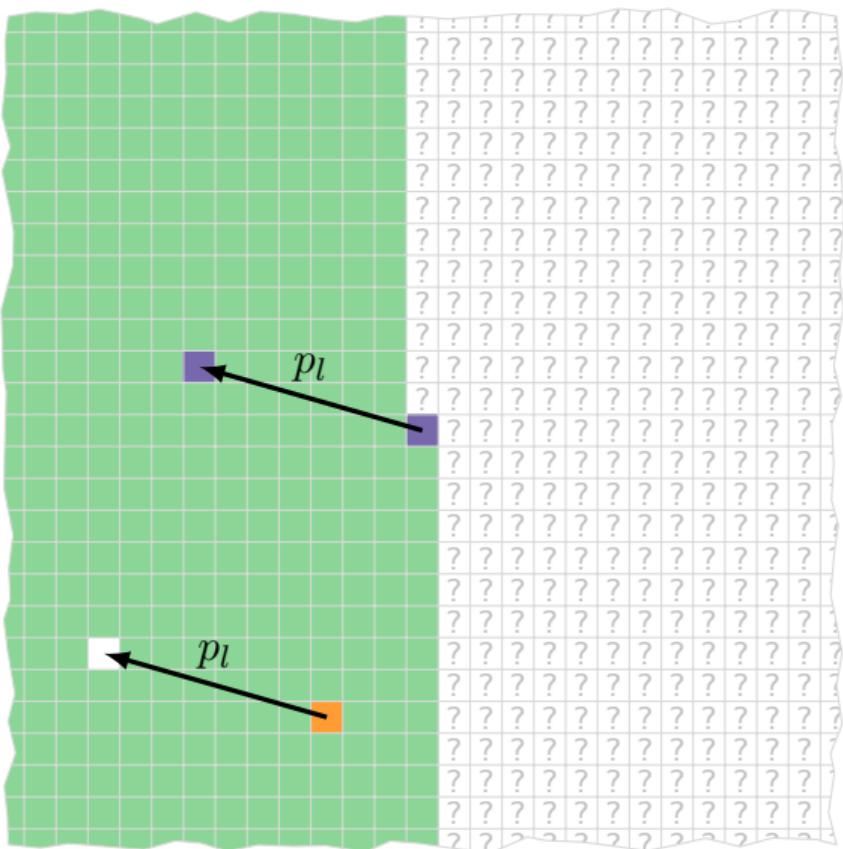

Proof.

Assume p_l and p_r are respective non-trivial periods for these configurations.

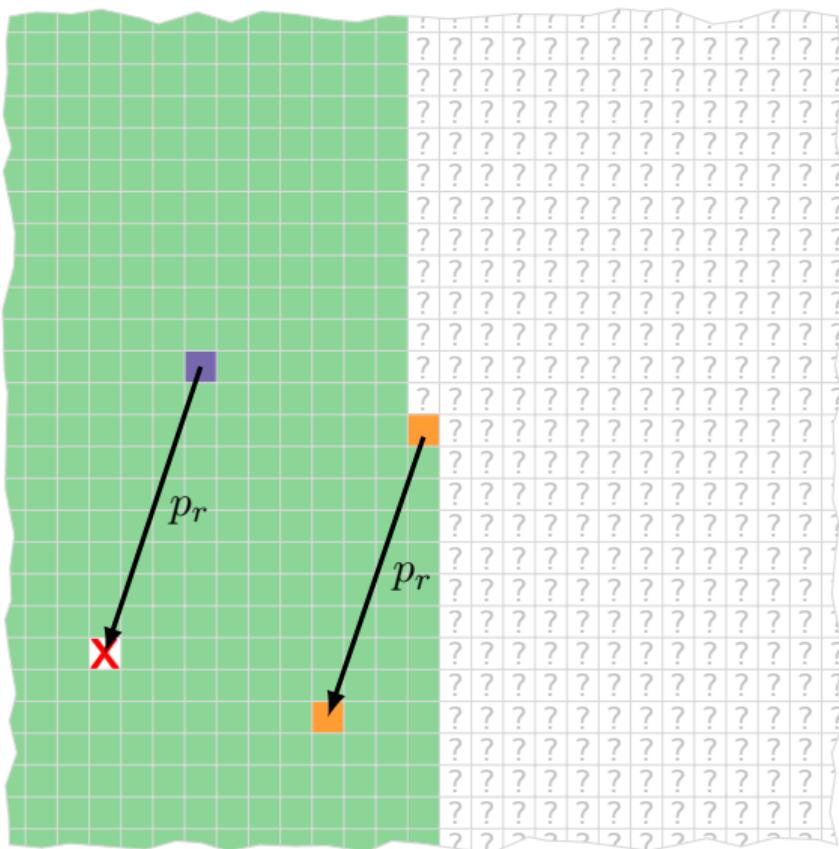

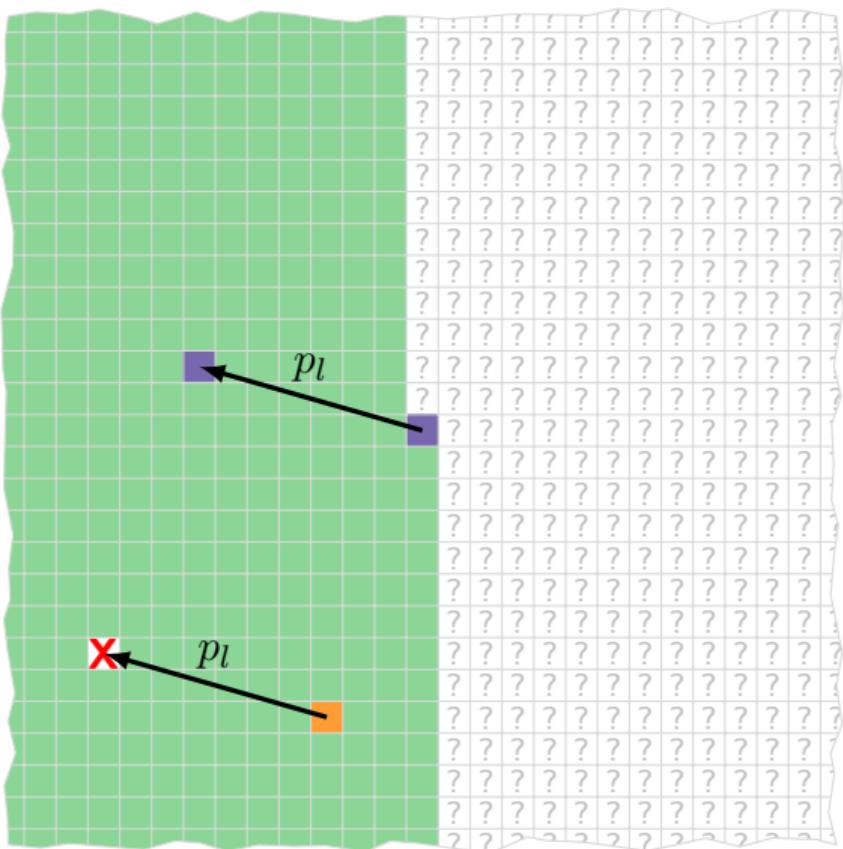

Proof.

Assume p_l and p_r are respective non-trivial periods for these configurations.

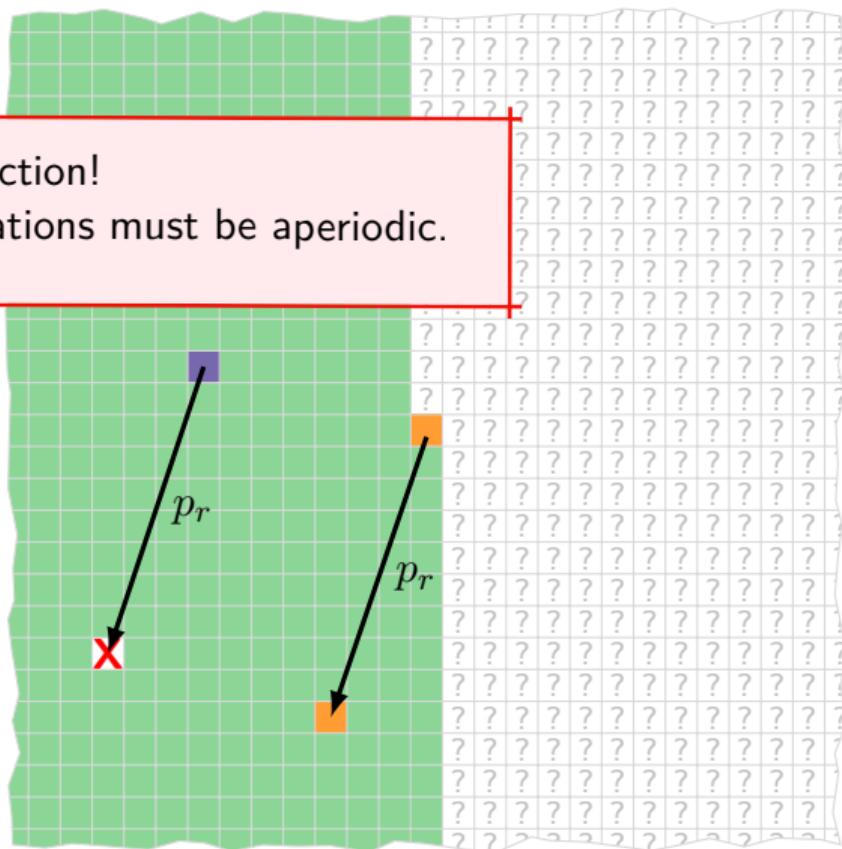

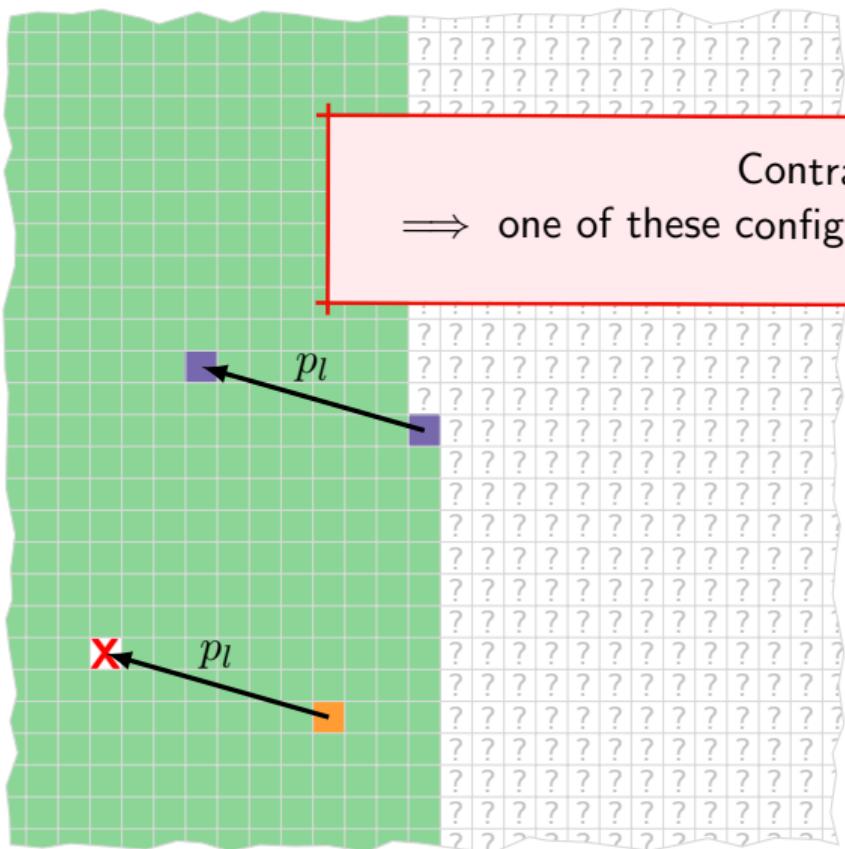

Proof.

Assume p_l and p_r are respective non-trivial periods for these configurations.

Proof.

Assume p_l and p_r are respective non-trivial periods for these configurations.

Contradiction!

\Rightarrow one of these configurations must be aperiodic.

On other groups than \mathbb{Z}^d ?

Let (G, \leq) be an ordered group.

Definition 4

Confluence

(G, \leq) is *confluent* if for any two vectors $a, b < 1_G$, a and b can be joined in the negative semi-lattice generated by a and b .

On other groups than \mathbb{Z}^d ?

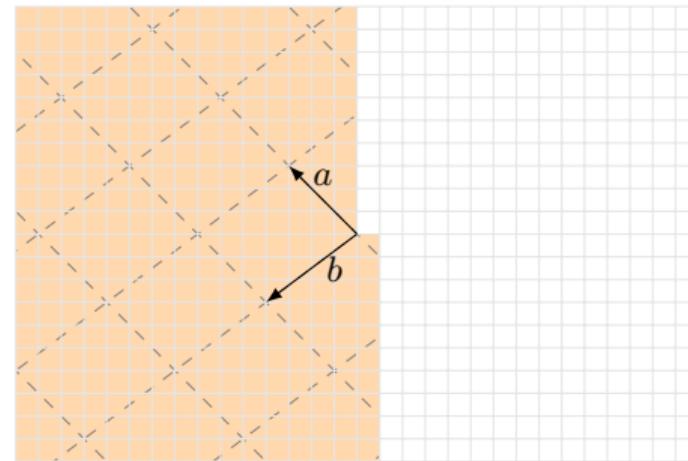

Let (G, \leq) be an ordered group.

Definition 4

Confluence

(G, \leq) is *confluent* if for any two vectors $a, b < 1_G$, a and b can be joined in the negative semi-lattice generated by a and b .

1. $(\mathbb{Z}^2, \leq_{lex})$ is confluent.

On other groups than \mathbb{Z}^d ?

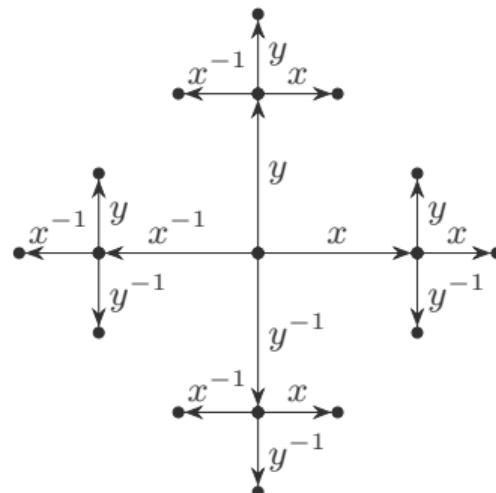

Let (G, \leq) be an ordered group.

Definition 4

Confluence

(G, \leq) is *confluent* if for any two vectors $a, b < 1_G$, a and b can be joined in the negative semi-lattice generated by a and b .

1. $(\mathbb{Z}^2, \leq_{lex})$ is confluent.
2. (\mathbb{F}_2, \leq) is not confluent.

On other groups than \mathbb{Z}^d ?

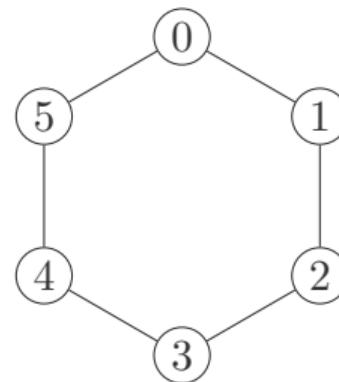

Let (G, \leq) be an ordered group.

Definition 4

Confluence

(G, \leq) is *confluent* if for any two vectors $a, b < 1_G$, a and b can be joined in the negative semi-lattice generated by a and b .

1. $(\mathbb{Z}^2, \leq_{lex})$ is confluent.
2. (\mathbb{F}_2, \leq) is not confluent.
3. $\mathbb{Z}/n\mathbb{Z}$ is not ordorable.

On other groups than \mathbb{Z}^d ?

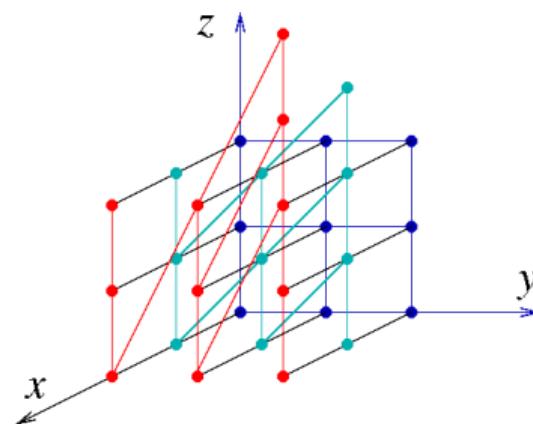

Let (G, \leq) be an ordered group.

Definition 4

Confluence

(G, \leq) is *confluent* if for any two vectors $a, b < 1_G$, a and b can be joined in the negative semi-lattice generated by a and b .

1. $(\mathbb{Z}^2, \leq_{lex})$ is confluent.
2. (\mathbb{F}_2, \leq) is not confluent.
3. $\mathbb{Z}/n\mathbb{Z}$ is not ordorable.
4. \mathcal{H} (Heisenberg group) is confluent.

On other groups than \mathbb{Z}^d ?

Let (G, \leq) be an ordered group.

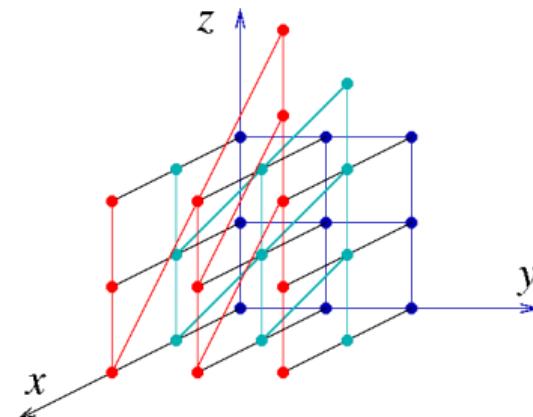

Definition 4

Confluence

(G, \leq) is *confluent* if for any two vectors $a, b < 1_G$, a and b can be joined in the negative semi-lattice generated by a and b .

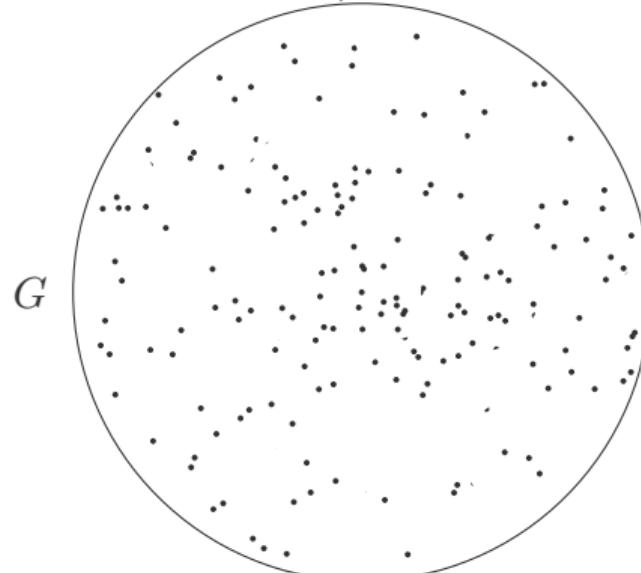

1. $(\mathbb{Z}^2, \leq_{lex})$ is confluent.
2. (\mathbb{F}_2, \leq) is not confluent.
3. $\mathbb{Z}/n\mathbb{Z}$ is not ordorable.
4. \mathcal{H} (Heisenberg group) is confluent.

So (torsion-free) abelian groups are confluent.
 \mathcal{H} (nilpotent) is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \rightarrow H \rightarrow G \rightarrow G/H \rightarrow 1$ be a short exact sequence.

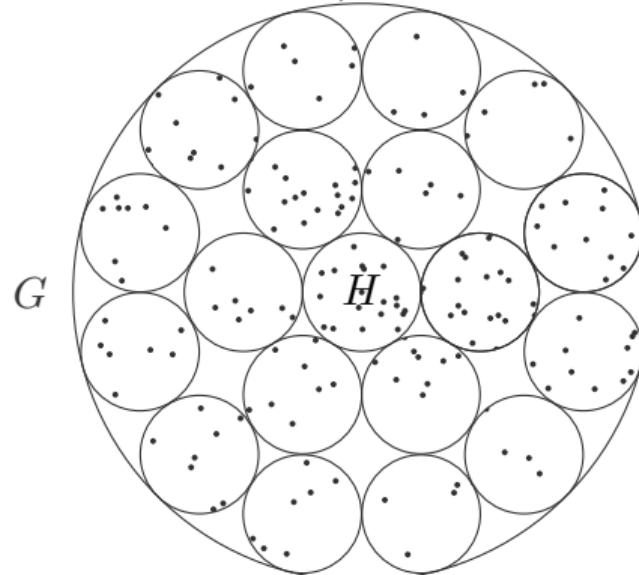

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \mapsto H \mapsto G \mapsto G/H \mapsto 1$ be a short exact sequence.

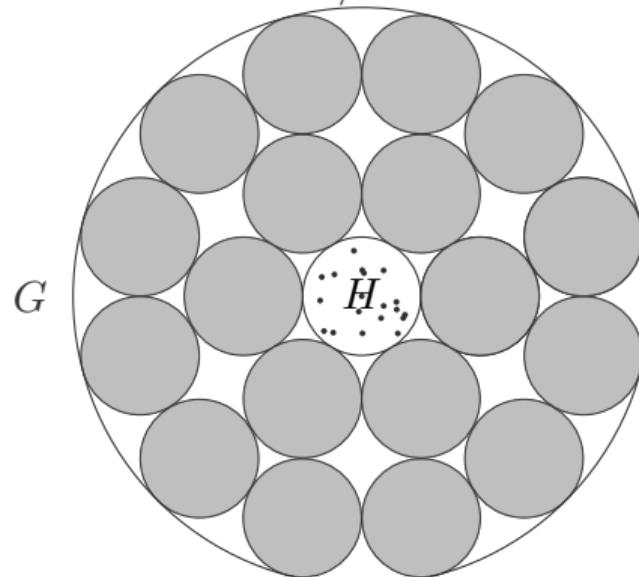

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \rightarrow H \rightarrow G \rightarrow G/H \rightarrow 1$ be a short exact sequence.

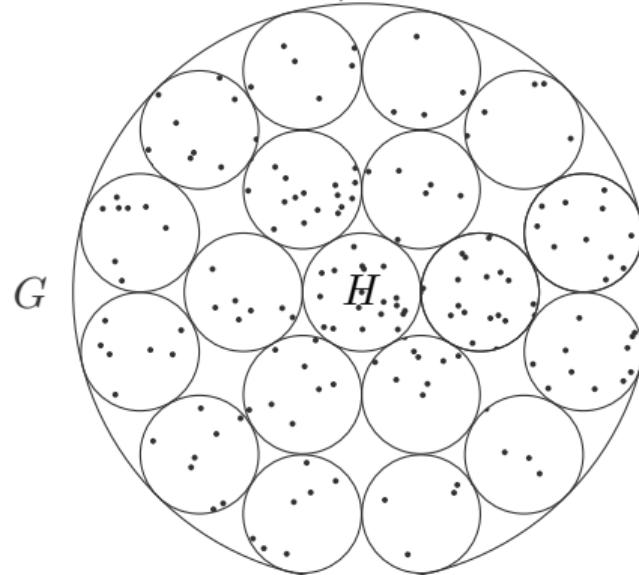

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \mapsto H \mapsto G \mapsto G/H \mapsto 1$ be a short exact sequence.

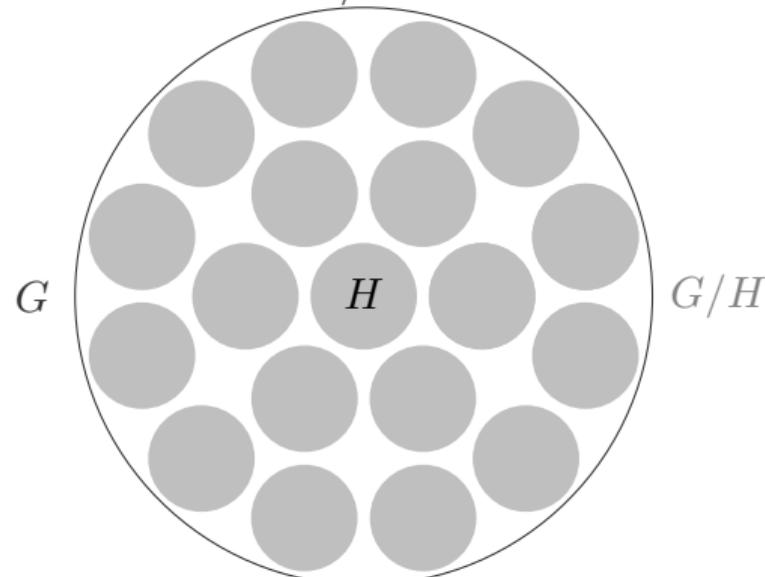

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \mapsto H \mapsto G \mapsto G/H \mapsto 1$ be a short exact sequence.

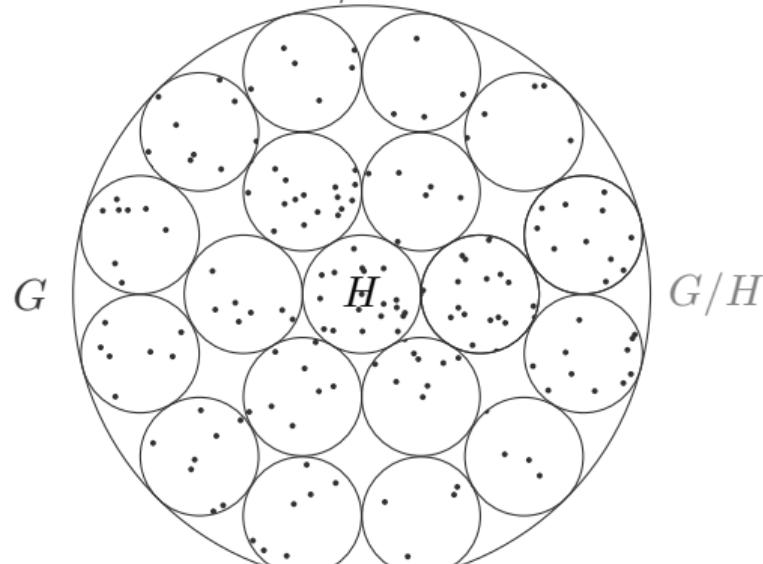

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \mapsto H \mapsto G \mapsto G/H \mapsto 1$ be a short exact sequence.

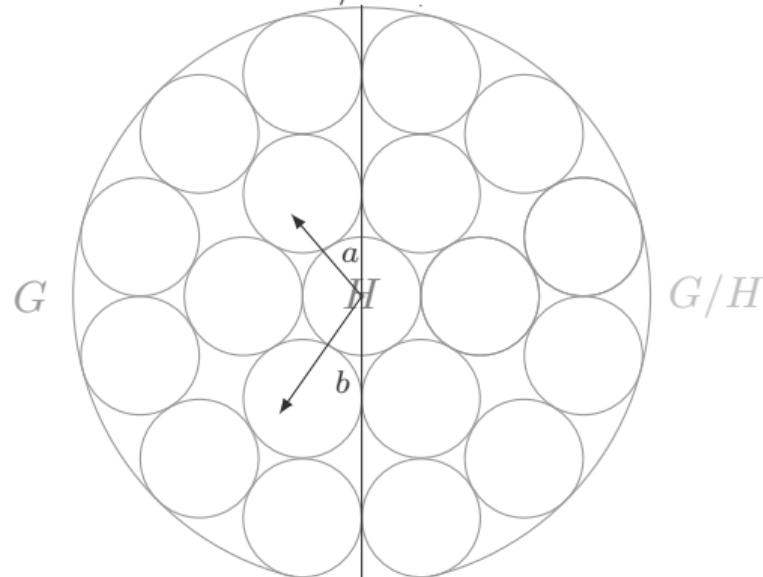

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \mapsto H \mapsto G \mapsto G/H \mapsto 1$ be a short exact sequence.

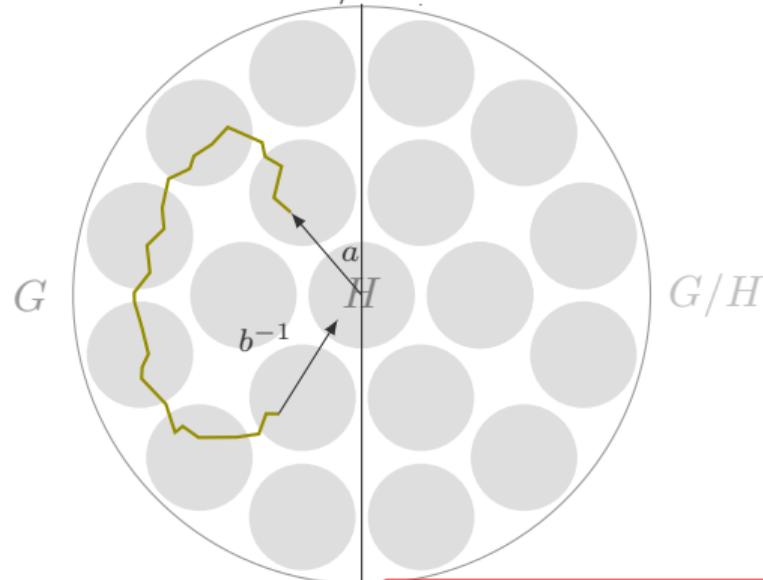

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \mapsto H \mapsto G \mapsto G/H \mapsto 1$ be a short exact sequence.

By confluence on G/H , there exists $A = awb^{-1}$ joining a and b in $(G/H)^-$.

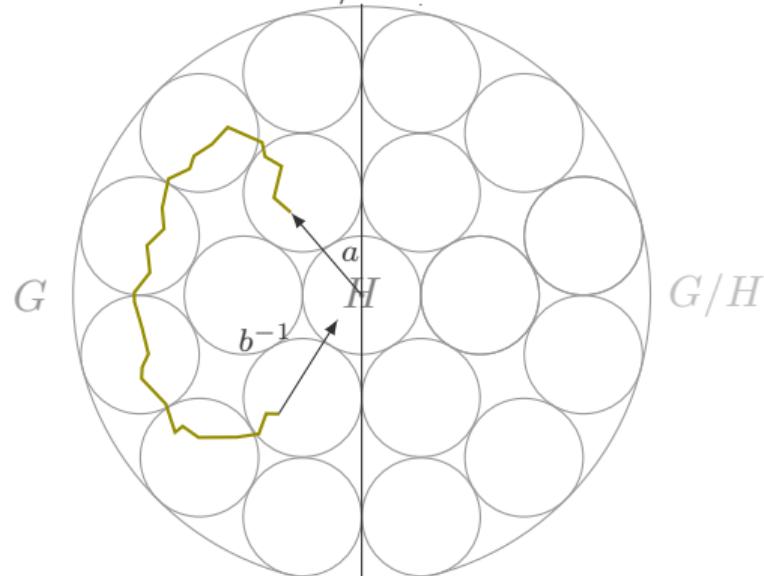

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \mapsto H \mapsto G \mapsto G/H \mapsto 1$ be a short exact sequence.

By confluence on G/H , there exists $A = awb^{-1}$ joining a and b in $(G/H)^-$.

Considering A in G , A ends up in $1_{G/H} = H$.

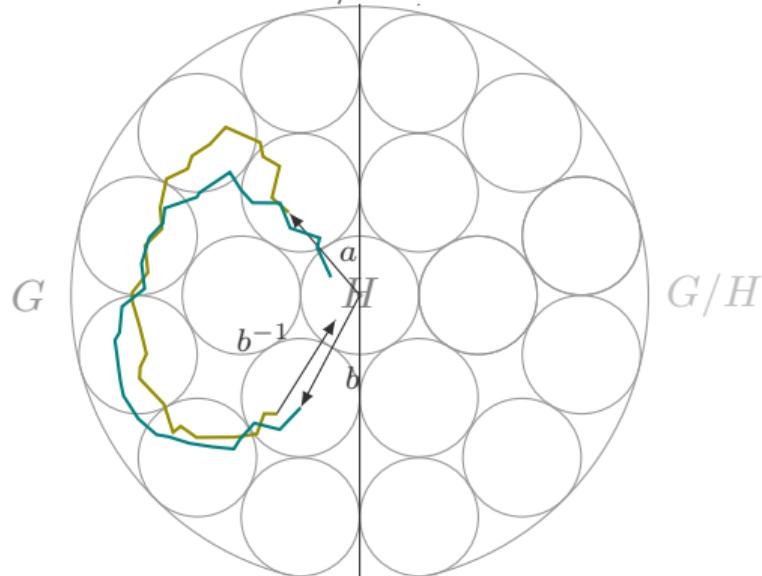

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \rightarrow H \rightarrow G \rightarrow G/H \rightarrow 1$ be a short exact sequence.

By confluence on G/H , there exists $A = awb^{-1}$ joining a and b in $(G/H)^-$.

Considering A in G , A ends up in $1_{G/H} = H$.

Take $B = bAb^{-1}$. B ends up in H too!

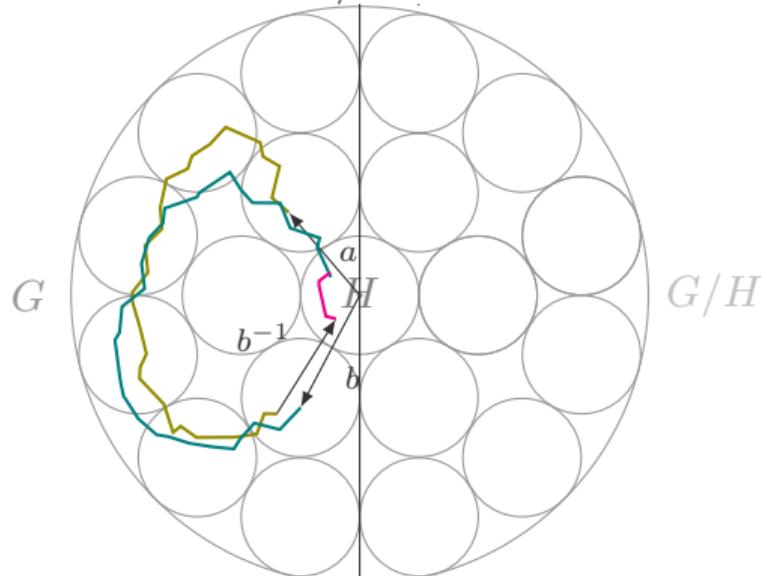

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \rightarrow H \rightarrow G \rightarrow G/H \rightarrow 1$ be a short exact sequence.

By confluence on G/H , there exists $A = awb^{-1}$ joining a and b in $(G/H)^-$.

Considering A in G , A ends up in $1_{G/H} = H$.

Take $B = bAb^{-1}$. B ends up in H too!

By confluence in H , there exists W such that AWB^{-1} joins A and B in H^- .

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

On other groups than \mathbb{Z}^d ?

Let $1 \mapsto H \mapsto G \mapsto G/H \mapsto 1$ be a short exact sequence.

Theorem 5

Stability by group extension

If both (H, \leq) and $(G/H, \leq)$ are confluent, then G is confluent.

Corrolary 6

Poly-(torsion-free abelian) ordored groups are confluent.

Theorem 7

If $X \subseteq \Sigma^G$ has “infinite surface entropy” and (G, \leq) is confluent, then X contains an aperiodic configuration.

Conclusion

Aperiodic Domino problem:

Input An effective \mathbb{Z}^d subshift.

Output Is there an admissible *aperiodic* coloring?

Relates to entropies:

For X a \mathbb{Z}^d subshift, if $h_{d-1}(X) = +\infty$, then X contains an aperiodic configuration.

The proof generalizes to groups, and relies on the notion of *confluence*:

(G, \leq) is *confluent* if for any two vectors $a, b < 1_G$, a and b can be joined in the negative semi-lattice generated by a and b .

That's all Folks!
