Shift spaces

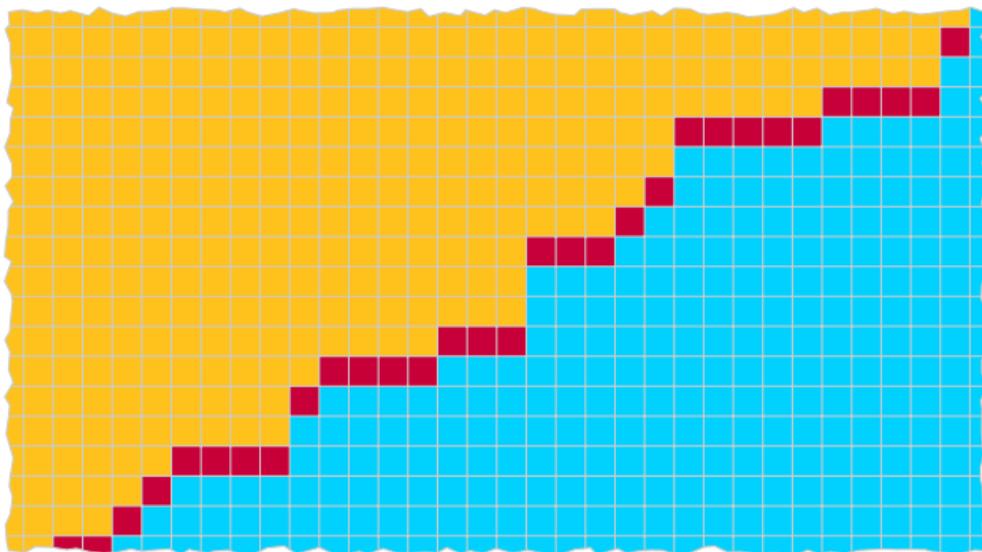

Definition

A *shift space* on \mathbb{Z}^d is a set of colorings $\mathbb{Z}^d \rightarrow \mathcal{A}$ (“configurations”) defined by forbidden patterns \mathcal{F} :

$$X_{\mathcal{F}} = \left\{ x \in \mathcal{A}^{\mathbb{Z}^d} : \forall w \in \mathcal{F}, w \text{ does not appear in } x \right\}.$$

Example:

$$\mathcal{F} = \left\{ \begin{array}{c} \text{red} \text{ } \text{yellow} \\ \text{yellow} \end{array}, \begin{array}{c} \text{red} \\ \text{yellow} \end{array}, \begin{array}{c} \text{cyan} \\ \text{red} \end{array}, \begin{array}{c} \text{cyan} \\ \text{yellow} \end{array}, \begin{array}{c} \text{yellow} \\ \text{cyan} \end{array} \right\}$$

Shift spaces

A shift space on \mathbb{Z}^d is a set of colorings $\mathbb{Z}^d \rightarrow \mathcal{A}$ (“configurations”) defined by forbidden patterns \mathcal{F} :

$$X_{\mathcal{F}} = \left\{ x \in \mathcal{A}^{\mathbb{Z}^d} : \forall w \in \mathcal{F}, w \text{ does not appear in } x \right\}.$$

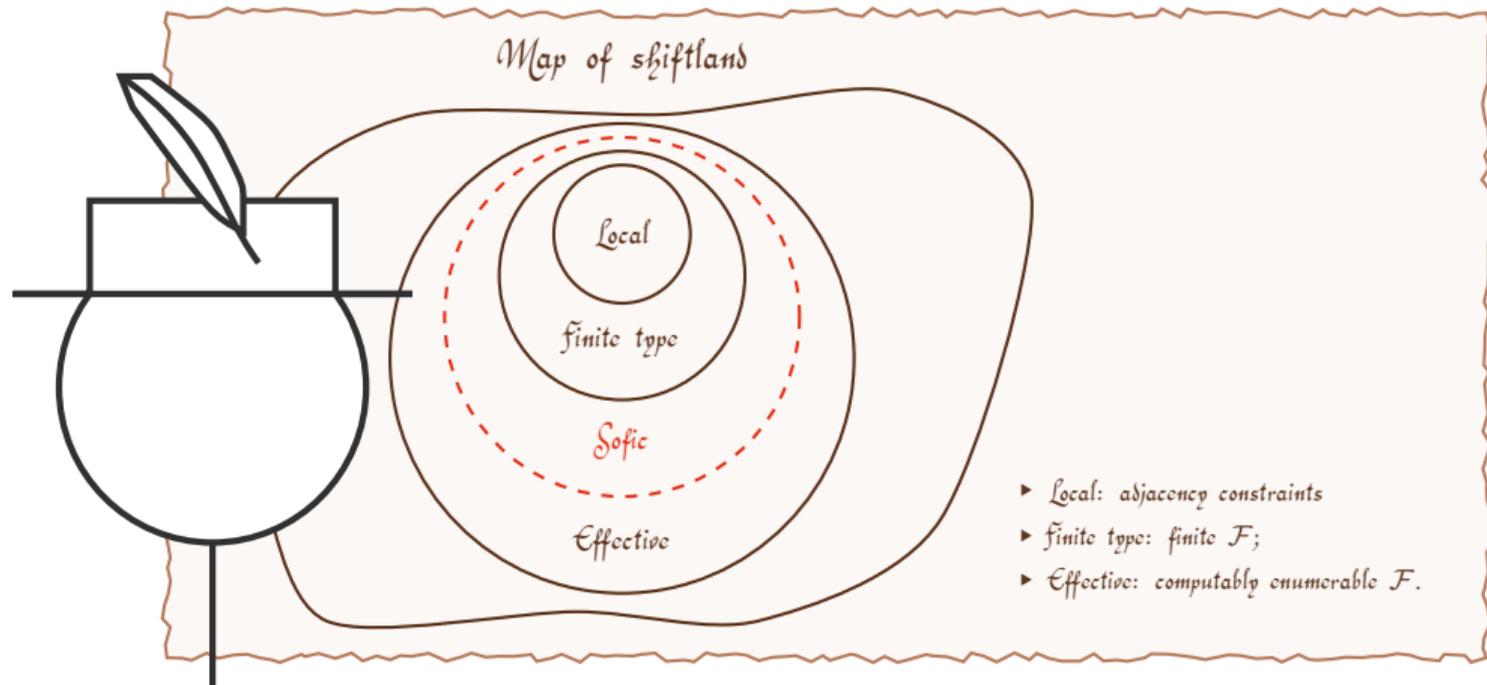

Classifying shift spaces by computational expressive power

Definition

A shift space on \mathbb{Z}^d is a set of colorings $\mathbb{Z}^d \rightarrow \mathcal{A}$ (“configurations”) defined by forbidden patterns \mathcal{F} :

$$X_{\mathcal{F}} = \{x \in \mathcal{A}^{\mathbb{Z}^d} : \forall w \in \mathcal{F}, w \text{ does not appear in } x\}.$$

Classifying shift spaces by computational expressive power

Definition

A shift space on \mathbb{Z}^d is a set of colorings $\mathbb{Z}^d \rightarrow \mathcal{A}$ (“configurations”) defined by forbidden patterns \mathcal{F} :

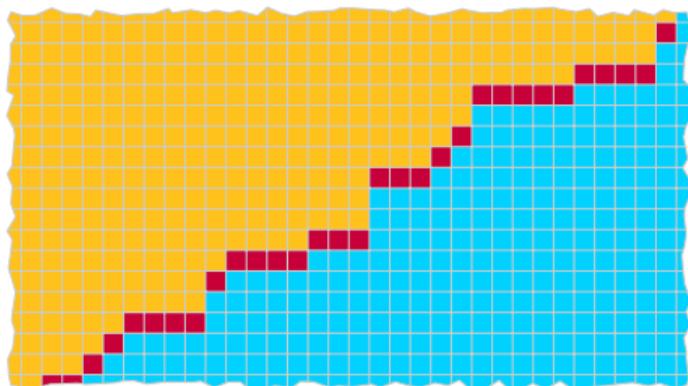

$$X_{\mathcal{F}} = \left\{ x \in \mathcal{A}^{\mathbb{Z}^d} : \forall w \in \mathcal{F}, w \text{ does not appear in } x \right\}.$$

Definition (Sofic space, \simeq 1973)

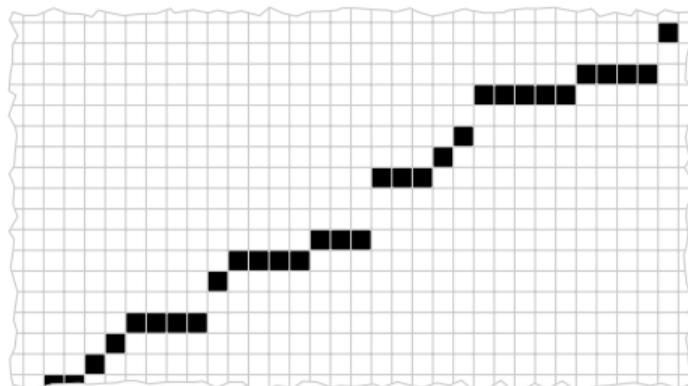

A shift space is *sofic* if it can be defined as the cell-by-cell projection of a local space.

$$\mathcal{F} = \left\{ \begin{array}{c} \text{red} \text{ yellow} \\ \text{yellow} \end{array}, \begin{array}{c} \text{red} \\ \text{yellow} \end{array}, \begin{array}{c} \text{cyan} \\ \text{yellow} \end{array}, \begin{array}{c} \text{cyan} \\ \text{red} \end{array}, \begin{array}{c} \text{yellow} \\ \text{cyan} \end{array} \right\}$$

$$\pi(\text{red}) = \text{black}, \quad \pi(\text{yellow}) = \pi(\text{cyan}) = \text{white}$$

Classifying shift spaces by computational expressive power

Definition

A shift space on \mathbb{Z}^d is a set of colorings $\mathbb{Z}^d \rightarrow \mathcal{A}$ (“configurations”) defined by forbidden patterns \mathcal{F} :

$$X_{\mathcal{F}} = \{x \in \mathcal{A}^{\mathbb{Z}^d} : \forall w \in \mathcal{F}, w \text{ does not appear in } x\}.$$

Shift spaces on \mathbb{Z}

Shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$

Local/finite type

Sofic

Effective

Language $L \subseteq \mathcal{A}^*$

Local

Rational/regular

Comp. co-enumerable

Example

The sunny-side-up $X_{\blacksquare} \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is sofic.

Shift spaces on \mathbb{Z}

Shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$

Local/finite type

Sofic

Effective

Language $L \subseteq \mathcal{A}^*$

Local

Rational/regular

Comp. co-enumerable

Example

The sunny-side-up $X_{\blacksquare} \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is sofic.

Shift spaces on \mathbb{Z}

Shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$

Local/finite type

Sofic

Effective

Language $L \subseteq \mathcal{A}^*$

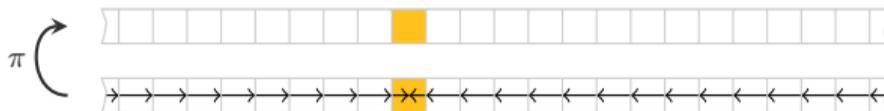

Local

Rational/regular

Comp. co-enumerable

Example

The sunny-side-up $X_{\blacksquare} \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is sofic.

Shift spaces on \mathbb{Z}

Shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$

Local/finite type

Sofic

Effective

Language $L \subseteq \mathcal{A}^*$

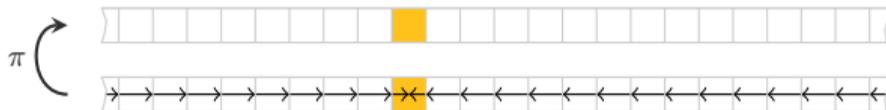

Local

Rational/regular

Comp. co-enumerable

Example

The sunny-side-up $X_{\blacksquare} \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is sofic.

Example

The space of all periods $X_p \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is not sofic.

Shift spaces on \mathbb{Z}

Shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$

Local/finite type

Sofic

Effective

Language $L \subseteq \mathcal{A}^*$

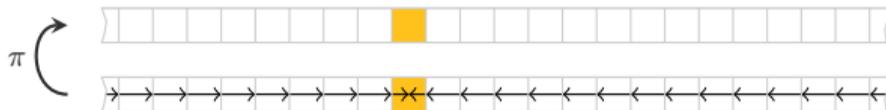

Local

Rational/regular

Comp. co-enumerable

Example

The sunny-side-up $X_{\blacksquare} \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is sofic.

Example

The space of all periods $X_p \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is not sofic.

Shift spaces on \mathbb{Z}

Shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$

Local/finite type

Sofic

Effective

Language $L \subseteq \mathcal{A}^*$

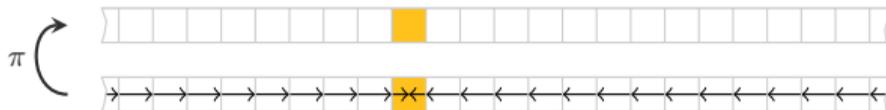

Local

Rational/regular

Comp. co-enumerable

Example

The sunny-side-up $X_{\square} \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is sofic.

Example

The space of all periods $X_p \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is not sofic.

Shift spaces on \mathbb{Z}

Shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$

Local/finite type

Sofic

Effective

Language $L \subseteq \mathcal{A}^*$

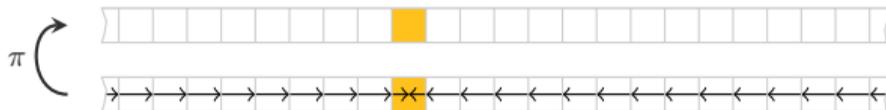

Local

Rational/regular

Comp. co-enumerable

Example

The sunny-side-up $X_{\square} \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is sofic.

Example

The space of all periods $X_p \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is not sofic.

Shift spaces on \mathbb{Z}

Shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$

Local/finite type

Sofic

Effective

Language $L \subseteq \mathcal{A}^*$

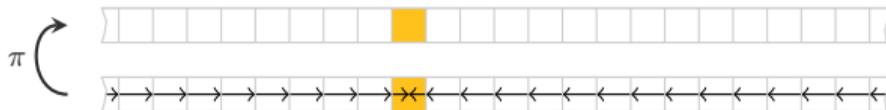

Local

Rational/regular

Comp. co-enumerable

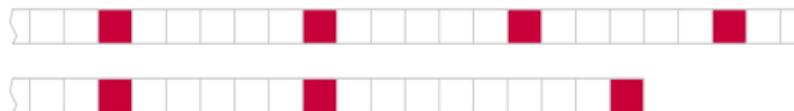

Example

The sunny-side-up $X_{\square} \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is sofic.

Example

The space of all periods $X_p \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is not sofic.

Shift spaces on \mathbb{Z}

Shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$

Local/finite type

Sofic

Effective

Language $L \subseteq \mathcal{A}^*$

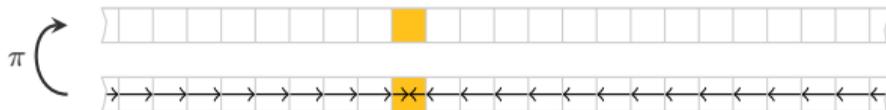

Local

Rational/regular

Comp. co-enumerable

Example

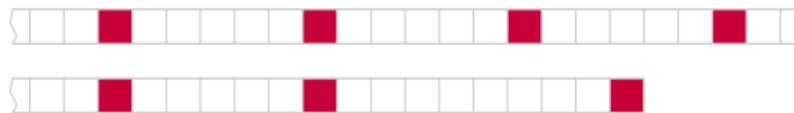

The sunny-side-up $X_{\blacksquare} \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is sofic.

$L = \square^* \blacksquare \square^*$
is regular.

Example

The space of all periods $X_p \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is not sofic.

$L = \{\square^n \blacksquare \square^n : n \in \mathbb{N}\}$
is not regular.

Shift spaces on \mathbb{Z}

Shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$

Local/finite type

Sofic

Effective

Language $L \subseteq \mathcal{A}^*$

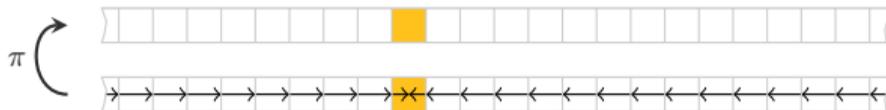

Local

Rational/regular

Comp. co-enumerable

Example

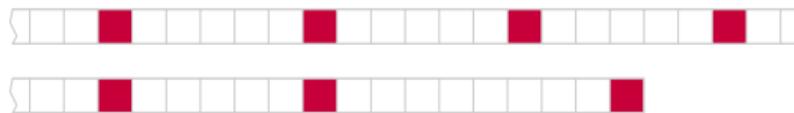

The sunny-side-up $X_{\blacksquare} \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is sofic.

$L = \square^* \blacksquare \square^*$
is regular.

Example

The space of all periods $X_p \subseteq \{\square, \blacksquare\}^{\mathbb{Z}}$ is not sofic.

$L = \{\square^n \blacksquare \square^n : n \in \mathbb{N}\}$
is not regular.

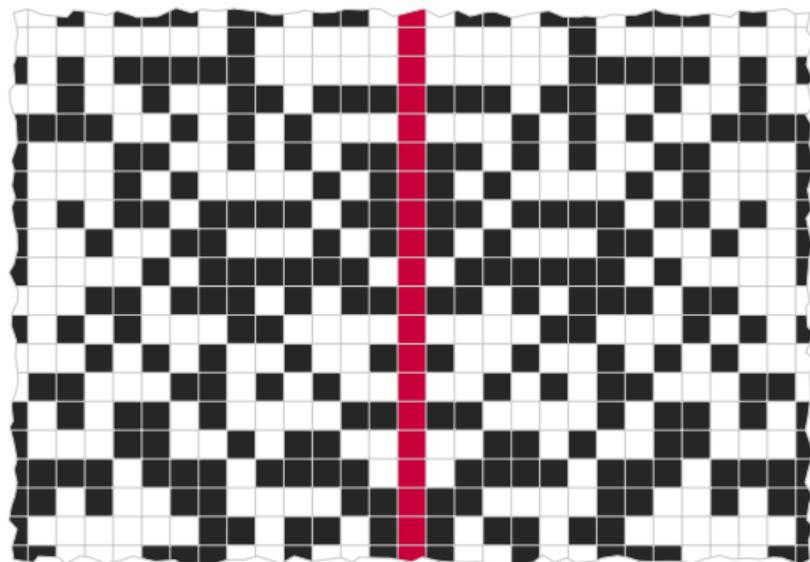

Lemma (Myhill-Nerode)

A shift space $X \subseteq \mathcal{A}^{\mathbb{Z}}$ is sofic if and only if it defines finitely many *extender sets* (i.e. “contexts”).

Soficity of shift spaces on \mathbb{Z}^d : information bounds

Example

The mirror shift space is **not** sofic on \mathbb{Z}^d for any $d \in \mathbb{N}$:

(folklore)

Soficity of shift spaces on \mathbb{Z}^d : information bounds

Example

The mirror shift space is **not** sofic on \mathbb{Z}^d for any $d \in \mathbb{N}$:

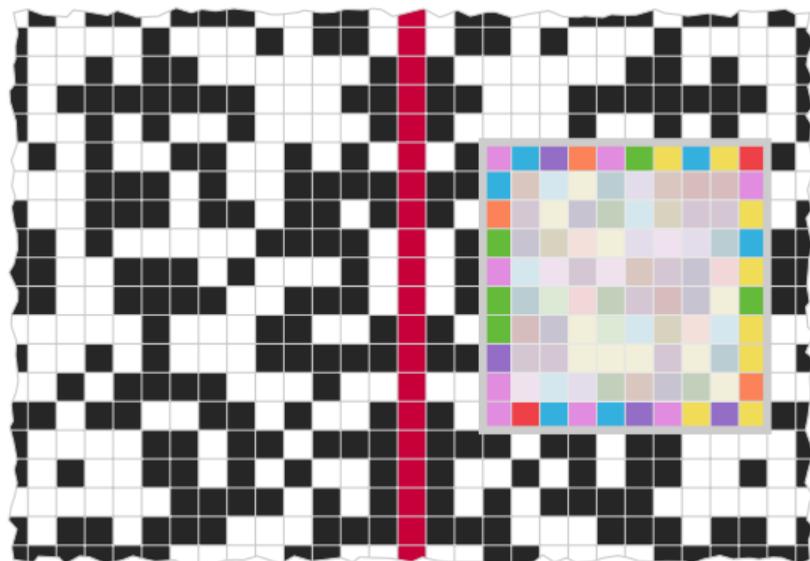

Pattern $O(n^d)$;
Border $O(n^{d-1})$;

(folklore)

Soficity of shift spaces on \mathbb{Z}^d : information bounds

Example

The mirror shift space is **not** sofic on \mathbb{Z}^d for any $d \in \mathbb{N}$:

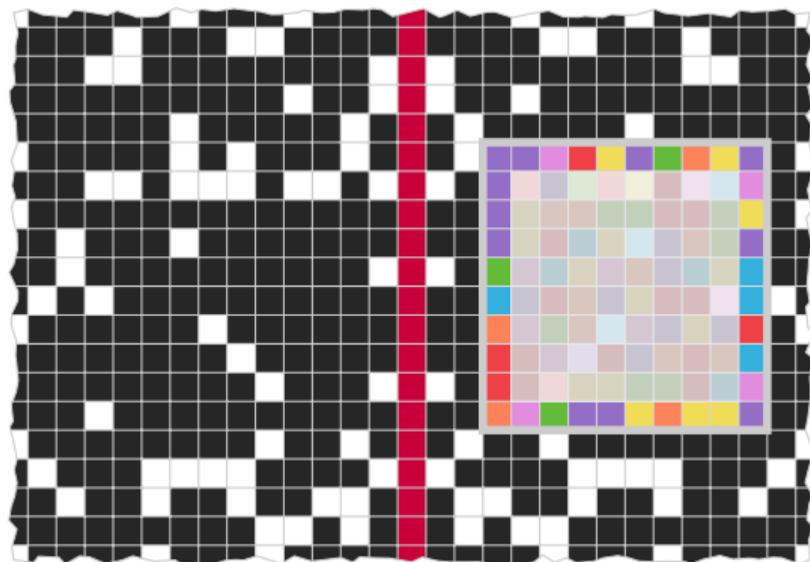

Pattern $O(n^d)$;
Border $O(n^{d-1})$;

(folklore)

Soficity of shift spaces on \mathbb{Z}^d : information bounds

Example

The mirror shift space is **not** sofic on \mathbb{Z}^d for any $d \in \mathbb{N}$:

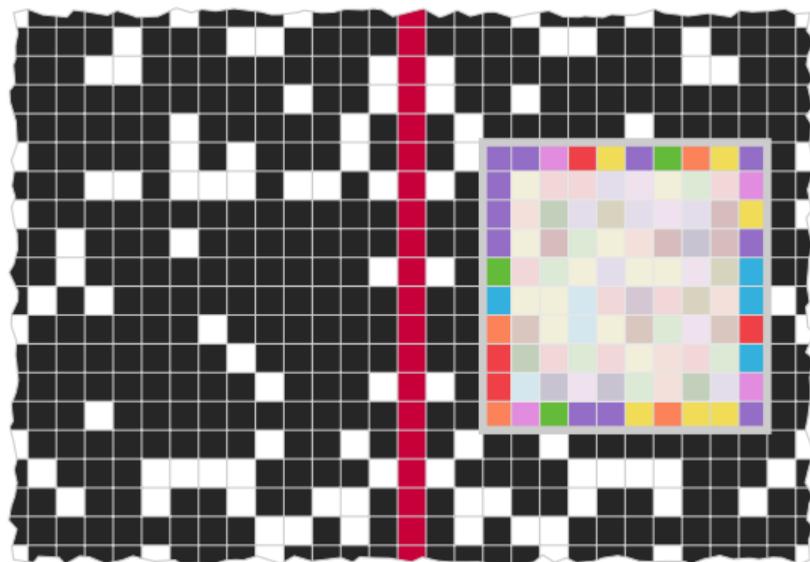

Pattern $O(n^d)$;
Border $O(n^{d-1})$;

(folklore)

Soficity of shift spaces on \mathbb{Z}^d : information bounds

Example

The mirror shift space is **not** sofic on \mathbb{Z}^d for any $d \in \mathbb{N}$:

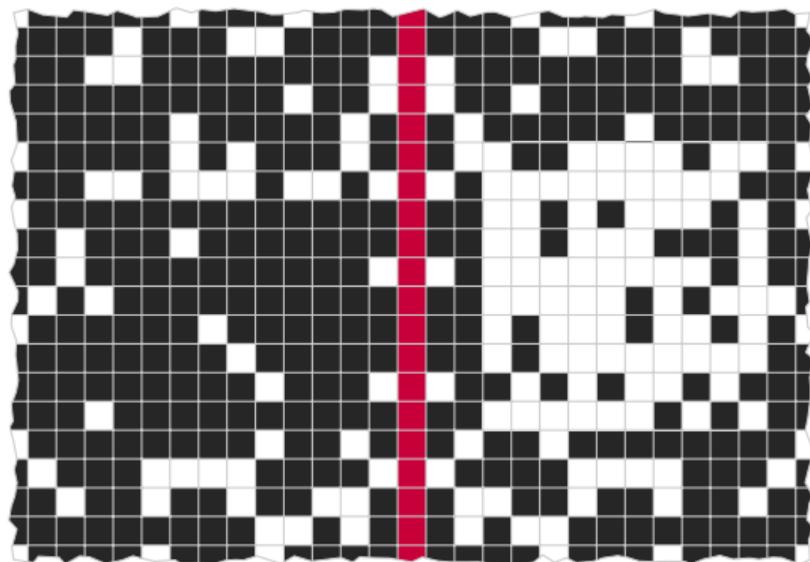

Pattern $O(n^d)$;
Border $O(n^{d-1})$;

(folklore)

Soficity of shift spaces on \mathbb{Z}^d : information bounds

Example

The mirror shift space is **not** sofic on \mathbb{Z}^d for any $d \in \mathbb{N}$:

Pattern $O(n^d)$;
Border $O(n^{d-1})$;

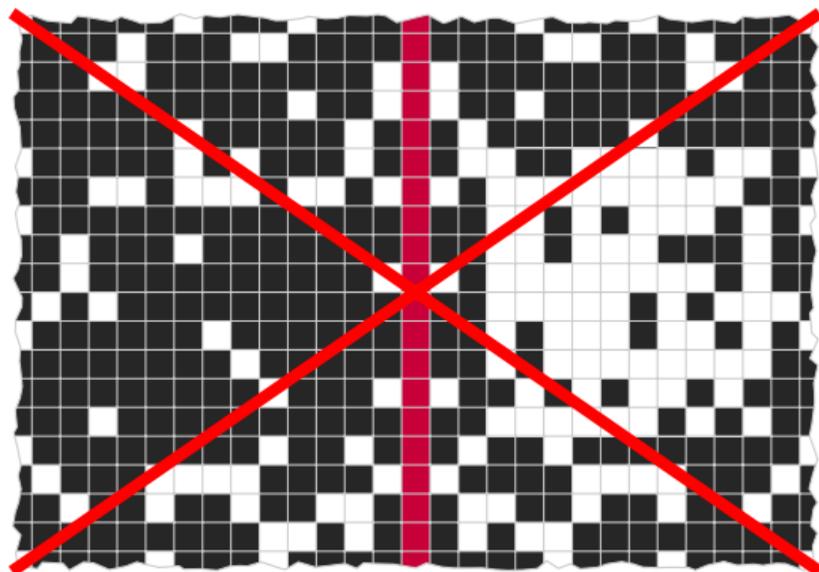

(folklore)

Soficity of shift spaces on \mathbb{Z}^d : information bounds

Example

The mirror shift space is **not** sofic on \mathbb{Z}^d for any $d \in \mathbb{N}$:

Pattern $O(n^d)$;
Border $O(n^{d-1})$;

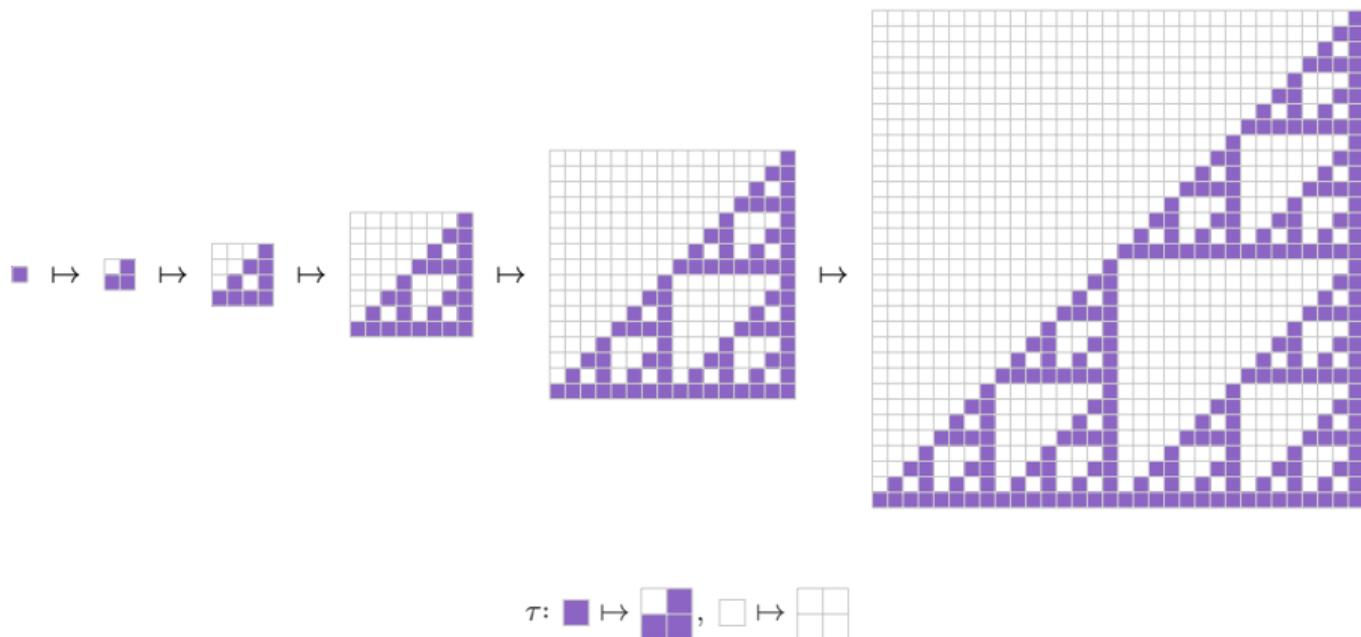

(folklore)

Intuition

Patterns of domain $\llbracket n \rrbracket^d$ in a sofic shift can only exchange $O(n^{d-1})$ bits with their exterior.

Fact

All these shifts can be proved sofic on \mathbb{Z}^d ($d \geq 2$) using the *fixed point construction*.

[Durand, Romashchenko & Shen, 2008+]

Sofic realization of s-adic limit spaces by self-simulation

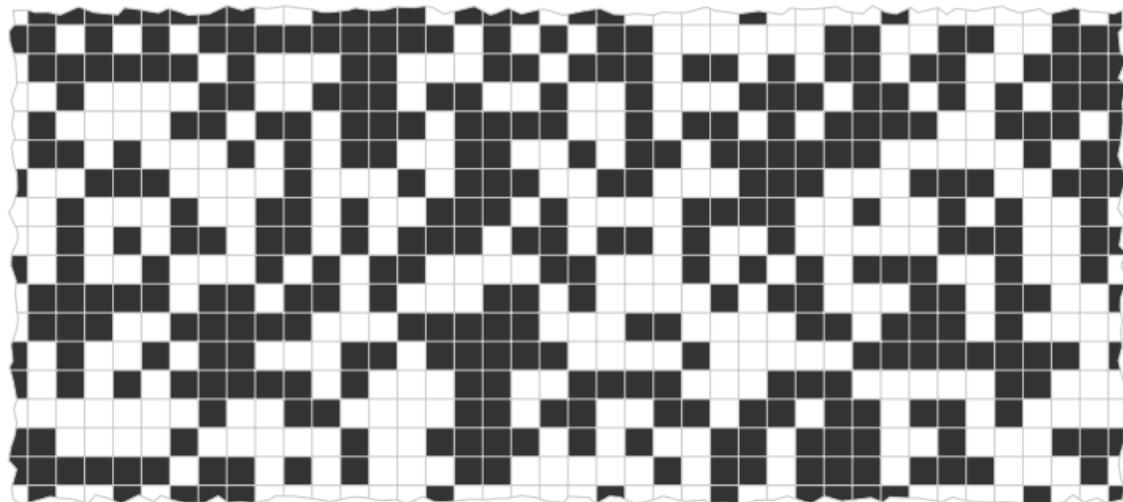

Substitutions

Definition

Given two alphabets \mathcal{A} , \mathcal{B} , and a zoom $N \in \mathbb{N}$, a *simulation* is an injective map

$$\mathcal{S}: \mathcal{A}^{[N]^d} \rightarrow \mathcal{B}.$$

A simulation \mathcal{S} induces a relation between configurations:

then

$$\left\{ x \in X_{T_0} : x = x_0 \xrightarrow[S_0]{S_0} x_1 \xrightarrow[S_1]{S_1} x_2 \xrightarrow[S_2]{S_2} \dots \right\}$$

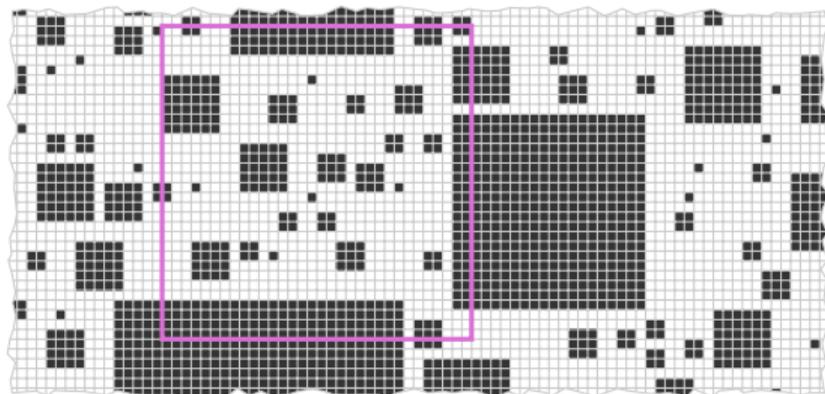

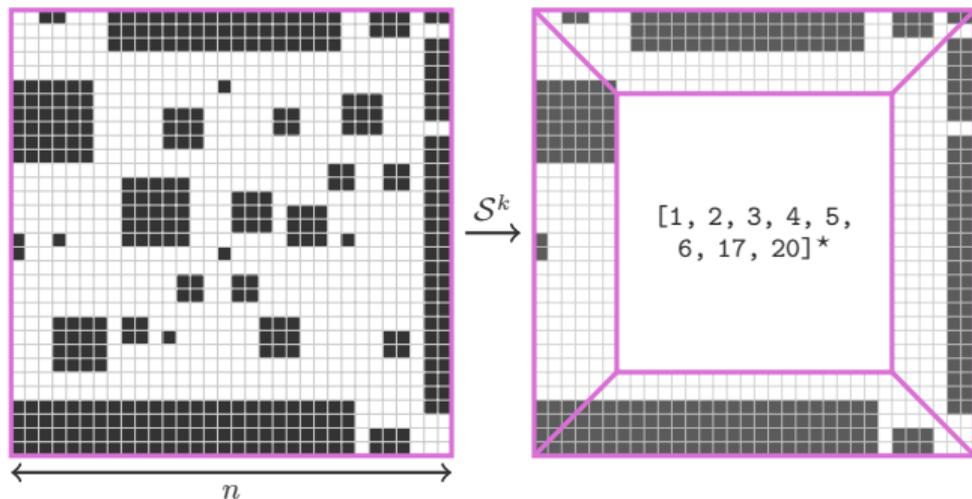

is a sofic shift.

Seas of squares: [Westrick, 2017]

For $S \subseteq \mathbb{N}$ a Π_1^0 -computable set, X draws independent \blacksquare squares of sizes in S over a \square background.

Example 1: seas of squares

Theorem

Let X_{T_ℓ} be a sequence of tiling spaces on colors $(C_\ell)_{\ell \in \mathbb{N}}$ and

$$S_\ell: T_\ell^{[N_\ell]^{d^d}} \rightarrow T_{\ell+1}$$

be simulations between X_{T_ℓ} and $X_{T_{\ell+1}}$. Denote $L_\ell = \prod_{i=0}^{\ell-1} N_i$. If:

- (i) All colors $c \in C_{\ell+1}$ are of size $O(L_\ell^\alpha)$ for some $\alpha < d-1$;
- (ii) The simulations S_ℓ are computable in time $O(L_\ell^d)$;
- (iii) $N_\ell \in [2, 2^{L_\ell^\delta}]$ for some $\delta < \frac{d-1}{2}$;

then

$$\left\{ x \in X_{T_0} : x = x_0 \xrightarrow[S_0]{S_0} x_1 \xrightarrow[S_1]{S_1} x_2 \xrightarrow[S_2]{S_2} \dots \right\}$$

is a sofic shift.

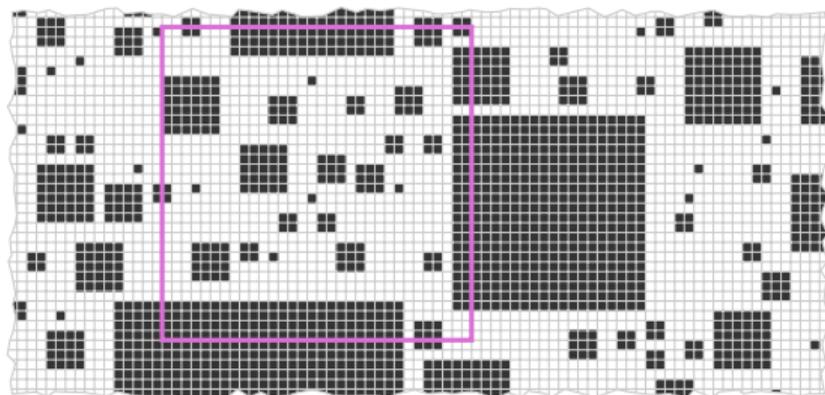

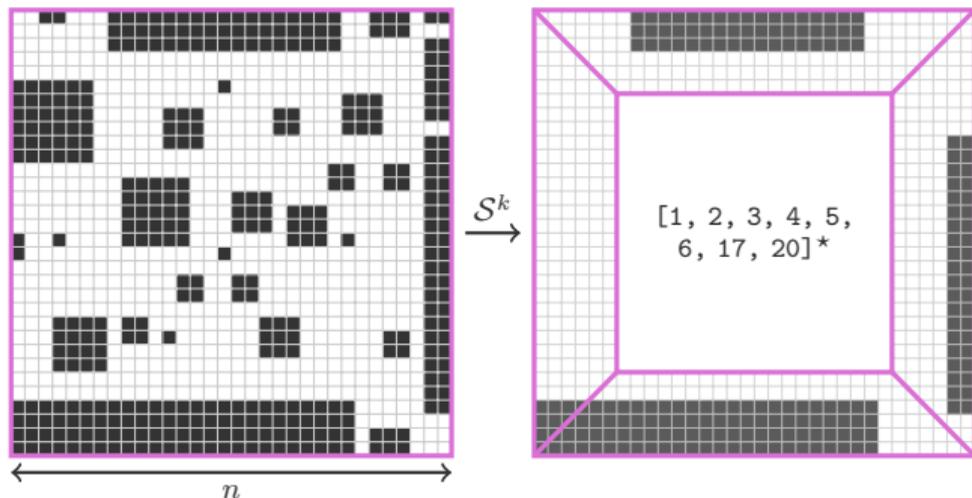

* Check the lengths against an enumeration of S .

Seas of squares: [Westrick, 2017]

For $S \subseteq \mathbb{N}$ a Π_1^0 -computable set, X draws independent \blacksquare squares of sizes in S over a \square background.

For a pattern of domain $\llbracket n \rrbracket^2$:
colors of size $O(n^{2/3} \cdot \log n)$.

Example 1: seas of squares

Theorem

Let X_{T_ℓ} be a sequence of tiling spaces on colors $(C_\ell)_{\ell \in \mathbb{N}}$ and

$$S_\ell: T_\ell^{[N_\ell, I]^{d'}} \rightarrow T_{\ell+1}$$

be simulations between X_{T_ℓ} and $X_{T_{\ell+1}}$. Denote $L_\ell = \prod_{i=0}^{\ell-1} N_i$. If:

- (i) All colors $c \in C_{\ell+1}$ are of size $O(L_\ell^\alpha)$ for some $\alpha < d-1$;
- (ii) The simulations S_ℓ are computable in time $O(L_\ell^\delta)$;
- (iii) $N_\ell \in [2, 2^{L_\ell^\delta}]$ for some $\delta < \frac{d-1}{2}$;

then

$$\left\{ x \in X_{T_0} : x = x_0 \xrightarrow[S_0]{S_0} x_1 \xrightarrow[S_1]{S_1} x_2 \xrightarrow[S_2]{S_2} \dots \right\}$$

is a sofic shift.

* Check the lengths against an enumeration of S .

Seas of squares: [Westrick, 2017]

For $S \subseteq \mathbb{N}$ a Π_1^0 -computable set, X draws independent \blacksquare squares of sizes in S over a \square background.

For a pattern of domain $\llbracket n \rrbracket^2$:
colors of size $O(n^{2/3} \cdot \log n)$.

Example 2: density

Theorem

Let X_{T_ℓ} be a sequence of tiling spaces on colors $(C_\ell)_{\ell \in \mathbb{N}}$ and

$$S_\ell: T_\ell^{\llbracket N_\ell \rrbracket^d} \rightarrow T_{\ell+1}$$

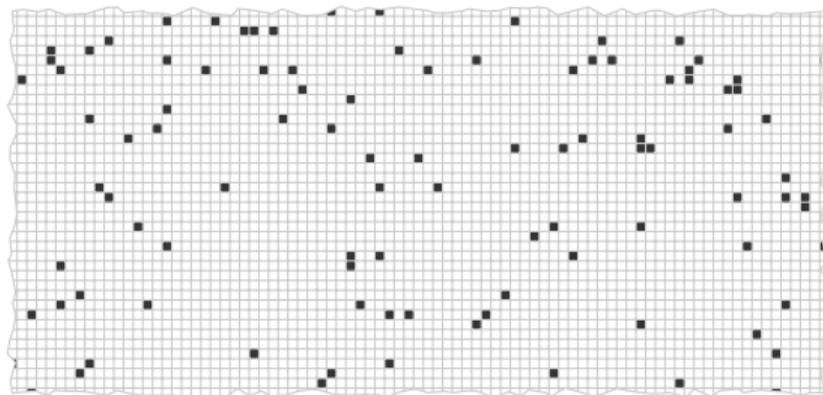

be simulations between X_{T_ℓ} and $X_{T_{\ell+1}}$. Denote $L_\ell = \prod_{i=0}^{\ell-1} N_i$. If:

- (i) All colors $c \in C_{\ell+1}$ are of size $O(L_\ell^\alpha)$ for some $\alpha < d - 1$;
- (ii) The simulations S_ℓ are computable in time $O(L_\ell^\alpha)$;
- (iii) $N_\ell \in \llbracket 2, 2^{L_\ell^\delta} \rrbracket$ for some $\delta < \frac{d-1}{2}$;

then

$$\left\{ x \in X_{T_0} : x = x_0 \xrightarrow[S_0]{S_0} x_1 \xrightarrow[S_1]{S_1} x_2 \xrightarrow[S_2]{S_2} \dots \right\}$$

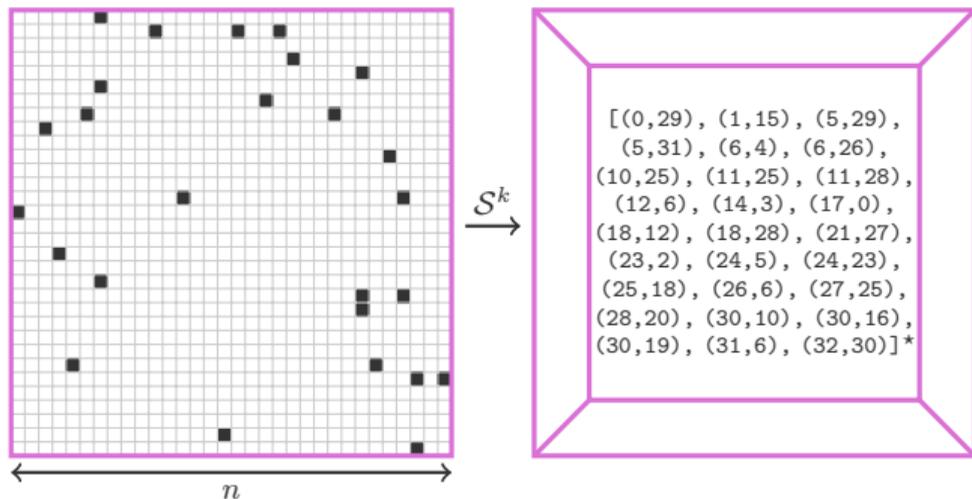

is a sofic shift.

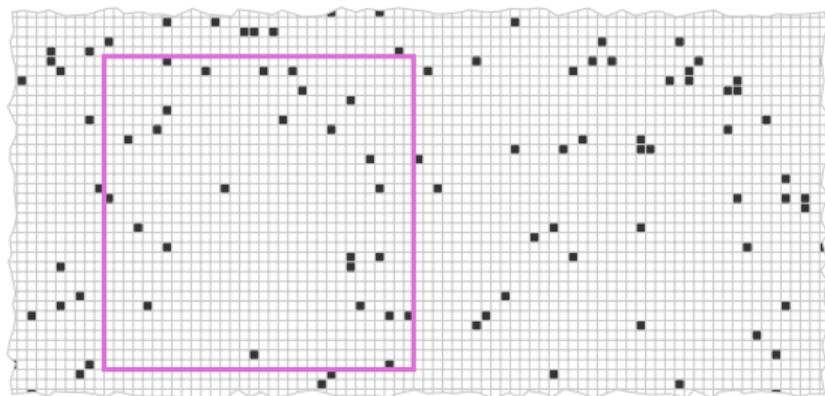

Density shifts: [Destombes, 2021]

$X \subseteq \{\blacksquare, \square\}^{\mathbb{Z}^d}$ effective such that patterns of domain $\llbracket n \rrbracket^d$ contain $O(n^\alpha)$ \blacksquare symbols for some $\alpha < d - 1$.

Example 2: density

$[(0, 29), (1, 15), (5, 29),$
 $(5, 31), (6, 4), (6, 26),$
 $(10, 25), (11, 25), (11, 28),$
 $(12, 6), (14, 3), (17, 0),$
 $(18, 12), (18, 28), (21, 27),$
 $(23, 2), (24, 5), (24, 23),$
 $(25, 18), (26, 6), (27, 25),$
 $(28, 20), (30, 10), (30, 16),$
 $(30, 19), (31, 6), (32, 30)]^*$

Theorem

Let X_{T_ℓ} be a sequence of tiling spaces on colors $(C_\ell)_{\ell \in \mathbb{N}}$ and

$$S_\ell: T_\ell^{\lfloor N_\ell \rfloor^d} \rightarrow T_{\ell+1}$$

be simulations between X_{T_ℓ} and $X_{T_{\ell+1}}$. Denote $L_\ell = \prod_{i=0}^{\ell-1} N_i$. If:

- (i) All colors $c \in C_{\ell+1}$ are of size $O(L_\ell^\alpha)$ for some $\alpha < d-1$;
- (ii) The simulations S_ℓ are computable in time $O(L_\ell^\delta)$;

- (iii) $N_\ell \in [2, 2^{L_\ell^\delta}]$ for some $\delta < \frac{d-1}{2}$;

then

$$\left\{ x \in X_{T_0} : x = x_0 \xrightarrow{S_0} x_1 \xrightarrow{S_1} x_2 \xrightarrow{S_2} \dots \right\}$$

is a sofic shift.

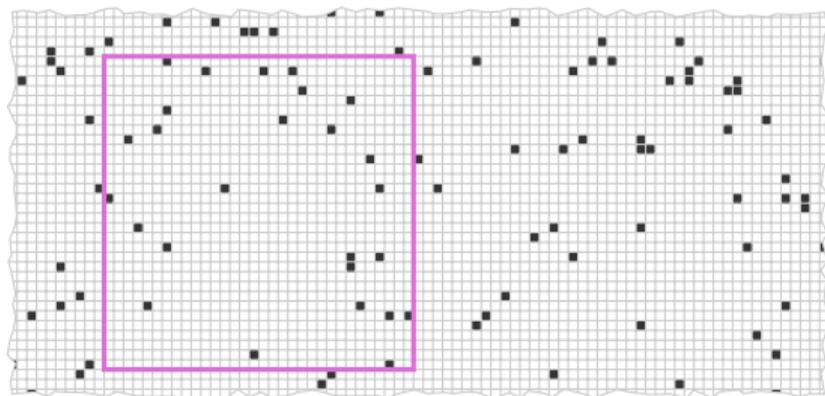

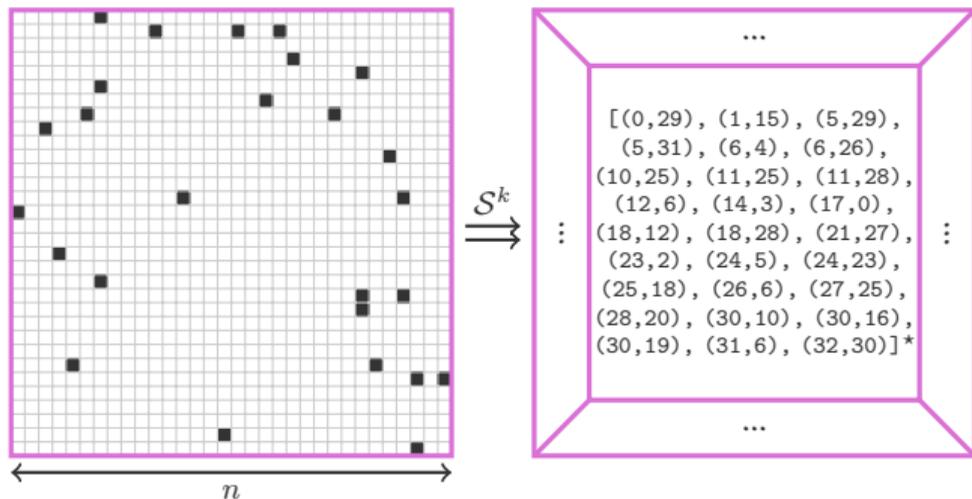

* Check \blacksquare positions against an enumeration of \mathcal{F} .

Density shifts: [Destombes, 2021]

$X \subseteq \{\blacksquare, \square\}^{\mathbb{Z}^d}$ effective such that patterns of domain $\llbracket n \rrbracket^d$ contain $O(n^\alpha)$ \blacksquare symbols for some $\alpha < d - 1$.

For a pattern of domain $\llbracket n \rrbracket^d$:
colors of size $O(n^\alpha)$.

Example 3: periodic extensions

Theorem

Let X_{T_ℓ} be a sequence of tiling spaces on colors $(C_\ell)_{\ell \in \mathbb{N}}$ and

$$S_\ell: T_\ell^{\lfloor N_\ell \rfloor^d} \rightarrow T_{\ell+1}$$

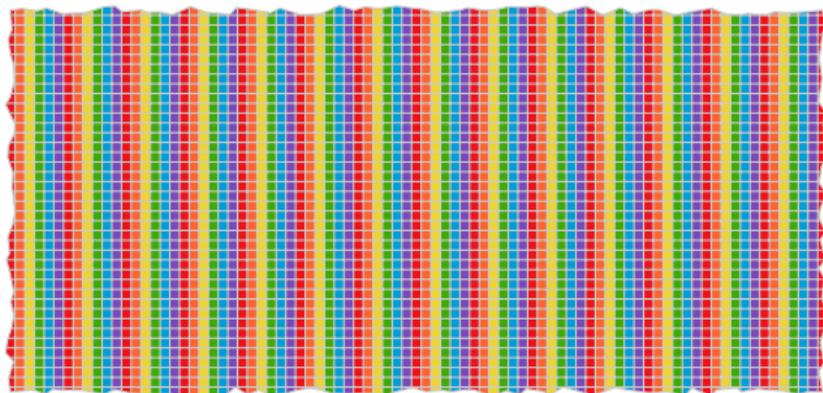

be simulations between X_{T_ℓ} and $X_{T_{\ell+1}}$. Denote $L_\ell = \prod_{i=0}^{\ell-1} N_i$. If:

- (i) All colors $c \in C_{\ell+1}$ are of size $O(L_\ell^\alpha)$ for some $\alpha < d-1$;
- (ii) The simulations S_ℓ are computable in time $O(L_\ell^\delta)$;
- (iii) $N_\ell \in \llbracket 2, 2^{L_\ell^\delta} \rrbracket$ for some $\delta < \frac{d-1}{2}$;

then

$$\left\{ x \in X_{T_0} : x = x_0 \xrightarrow{S_0} x_1 \xrightarrow{S_1} x_2 \xrightarrow{S_2} \dots \right\}$$

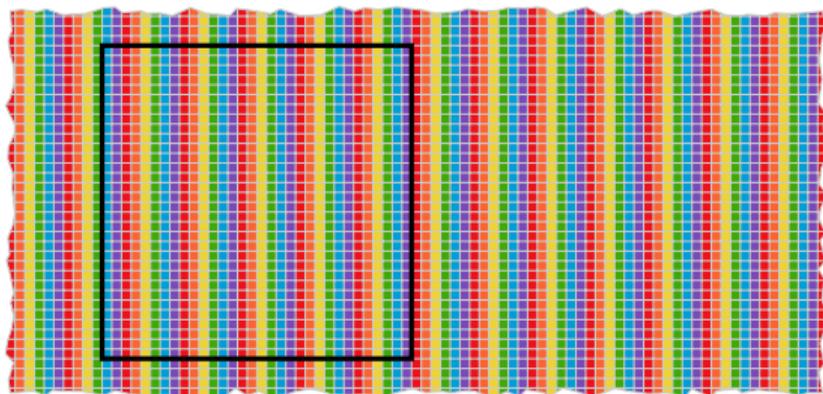

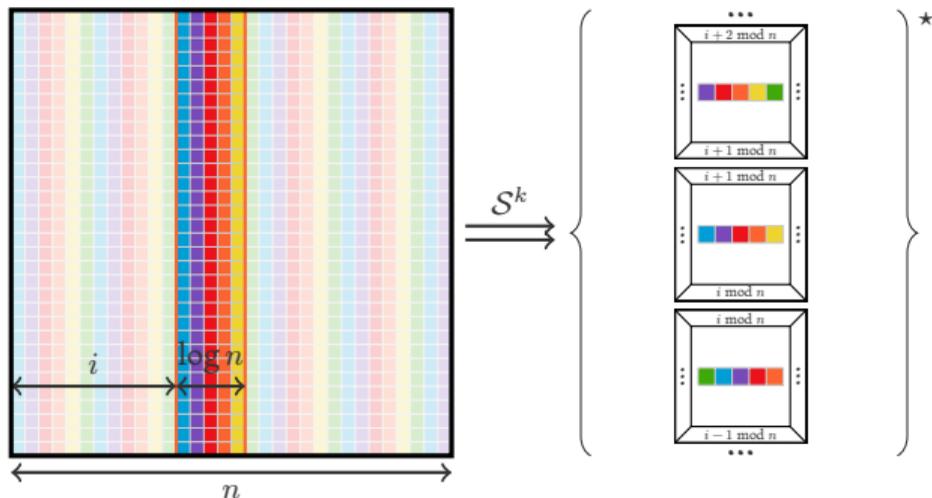

is a sofic shift.

Periodic extensions: [DRS, 2010]

Given $X \subseteq \mathcal{A}^{\mathbb{Z}^d}$ effective, the configurations of $\mathcal{A}^{\mathbb{Z}^{d+1}}$ repeating some facet $x \in X$ vertically.

Example 3: periodic extensions

Theorem

Let X_{T_ℓ} be a sequence of tiling spaces on colors $(C_\ell)_{\ell \in \mathbb{N}}$ and

$$S_\ell: T_\ell^{[N_\ell]^d} \rightarrow T_{\ell+1}$$

be simulations between X_{T_ℓ} and $X_{T_{\ell+1}}$. Denote $L_\ell = \prod_{i=0}^{\ell-1} N_i$. If:

- (i) All colors $c \in C_{\ell+1}$ are of size $O(L_\ell^\alpha)$ for some $\alpha < d-1$;

2. Tiles in T_ℓ “pick” the next level of simulation ℓ' (such that $b \leq \ell' < B$);
3. Macro-tiles resp. embed the simulation steps \mathcal{S}_j (for $b \leq j < B$).

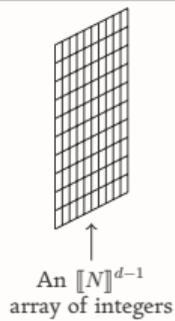

🚧 This only works if computations have enough room to terminate properly...

Drawing computation embeddings

Question

How many computation steps can one embed in a cube $[[N]]^d$?

Proposition (Cube wiring theorem)

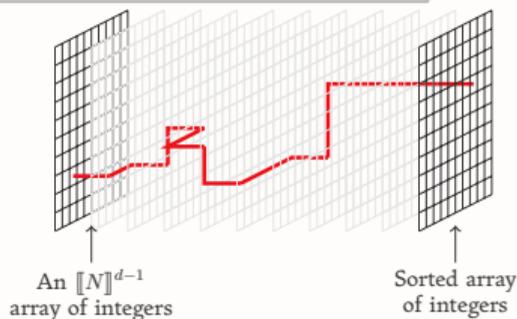

Drawing computation embeddings

Question

How many computation steps can one embed in a cube $\llbracket N \rrbracket^d$?

Proposition (Cube wiring theorem)

For any $\llbracket N \rrbracket^{d-1}$ array, there exists a wiring of depth N and $O(1)$ crossings sorting the cube.

Proof sketch [Thompson-Kung, 1976].

Sort rows (alternating order) and columns $\log N$ times:

| | | | | | | | | | |

Drawing computation embeddings

Question

How many computation steps can one embed in a cube $\llbracket N \rrbracket^d$?

Proposition (Cube wiring theorem)

For any $\llbracket N \rrbracket^{d-1}$ array, there exists a wiring of depth N and $O(1)$ crossings sorting the cube.

Proof sketch [Thompson-Kung, 1976].

Sort rows (alternating order) and columns $\log N$ times:

| | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|
| 0 | 1 | 2 | 5 | 6 | 7 | 9 | 11 | 14 | 15 |

□

RAM machines

- ▶ 32 variables $\text{var}_0, \text{var}_1 \dots$
- ▶ An infinite memory $(M[i])_{i \in \mathbb{N}}$.

Instructions: arithmetic operations on variables, and memory I/O.

Proof (folklore).

Given a trace of computation in chronological order,

... (address = 6, time = 15, READ, m); (address = 42, time = 16, READ, n) ...

check its correctness by sorting it lexicographically:

... (address = 42, time = 3, WRITE, n); (address = 42, time = 16, READ, n) ... □

Conclusion

Sofic shifts generalize regular languages to infinite and higher-dimensional words.

In this talk

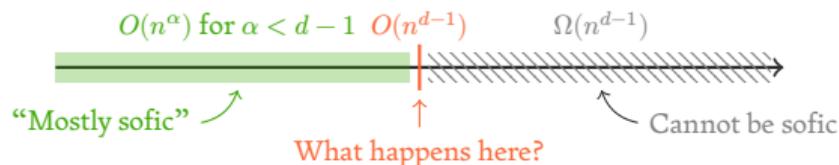

Proving soficity by quantifying the information in infinite sequences of substitutions.

Remarks:

- ▶ Block sizes anywhere in the interval $\llbracket 2, 2^{O(L_i^\delta)} \rrbracket$;
- ▶ Generalizes to rectangular substitutions;
- ▶ Generalizes to non-uniform substitutions.

Questions:

- ▶ How much computations can be embedded in a rectangle $\llbracket n_1, \dots, n_d \rrbracket$?
- ▶ Generalization to other geometries (i.e. Cayley graphs of groups);
- ▶ Formalization of the $O(n^{d-1})$ argument.

That's all Folks!
